

Q&A CEWOOD Panels

1. What are CEWOOD acoustic panels made of?

They're made from natural wood wool, cement, and water — all safe and eco-friendly.

2. What do acoustic panels do?

They absorb sound and reduce echo, making rooms quieter and more comfortable.

3. Are they safe for kids and families?

Yes. They're non-toxic, mold-resistant, and often used in schools and kindergartens.

4. Do they improve how a room sounds?

Absolutely — they help you hear speech more clearly and make spaces feel less noisy.

5. Where can I use them?

Almost anywhere indoors: offices, homes, schools, gyms, pools, theatres, and more.

6. Do they help in big, echoey rooms?

Yes. They're especially useful in large or loud spaces like gyms and halls.

7. Can I install them myself?

Yes. Basic tools are enough, or a builder can do it quickly.

8. Do they come in different colours?

Yes. There are standard options like white, grey, black, and custom colours on request.

9. Will natural wood panels all look the same?

No. Natural panels may have color variations — for even color, choose painted versions.

10. What's the difference between painted and natural panels?

Painted panels offer a consistent look. Natural panels show wood's natural variation.

11. Are CEWOOD panels fire safe?

Yes. They meet high European fire safety standards (A2-s1,d0 or B-s1,d0).

12. What's the best thickness for noise reduction?

25 mm or more is recommended for strong acoustic effect.

13. What's the benefit of adding mineral wool or acoustic fleece behind the panels?

It boosts sound absorption even more — up to 90–100% (class A performance).

14. Can I repaint the panels?

Yes, but only locally. It is not advised to overpaint all panel surface. Use water-based paint and don't overfill the surface to keep acoustic properties.

15. Can I clean the panels?

Yes. Use a vacuum with a soft brush or a damp cloth. Avoid soaking them in water.

16. Are they good for humid areas?

Yes. They're stable in moisture — perfect for pools, SPAs, and kitchens.

17. Do I need special ceiling structures to use them?

No. You can screw them directly to walls/ceilings or use standard suspension grid systems.

18. Can I cut the panels if needed?

Yes. You can cut them with basic tools like a hand saw or jigsaw. Always use protection to reduce dust.

19. Do I need to treat the edges after cutting?

If the panel is painted, you may want to repaint the cut edge to match. Natural panels don't require special treatment.

20. What if a panel gets damaged during installation?

Minor scratches can be sanded and repainted. For major damage, the panel should be replaced.

21. Do they block sound completely?

No. They reduce echo and sound reflection inside a room — they don't block outside noise.

22. Do CEWOOD panels help reduce noise between rooms?

Not directly. They improve the sound inside a room but don't insulate walls from outside noise. For that, you need soundproofing layers in the wall itself.

23. Are they heavy?

No. They're lightweight enough for easy handling and safe installation.

24. How long do they last?

Over 50 years — they're durable and don't lose performance over time.

25. Where can I see samples or learn more?

Visit www.cewood.com or email info@cewood.com for help.
