

## RECLOSABLE FILMS

For some time now, Estiko-Plastar has had reclosable films in its product range which give a nice addition to the overall portfolio of films that we offer.

These films have a pressure sensitive adhesive layer in between the film's layers which after opening acts as a means of resealing the package for several times. Before opening the package you will have the utmost seal integrity to ensure a stable environment for the product even if modified atmosphere is used. After opening and resealing the package, you will get a clean and neat package that keeps the product from drying out and stops excess contaminants getting in the package.

Our standard reclosable laminate has a thick outer layer to ensure that the lid does not curl after opening and that it will be fixed in the right position by just swiping your hand over it. An integrated EVOH layer will guarantee the longest possible shelf life for MAP applications.

All our reclosable films are fully compatible with the print and varnish effects that we offer.
