

SOFIE - Secure Open Federation for Internet Everywhere 779984

DELIVERABLE D6.5

Data Management Plan

Project title	SOFIE – Secure Open Federation for Internet Everywhere				
Contract Number	H2020-IOT-2017-3 – 779984				
Duration	1.1.2018 – 31.12.2020				
Date of preparation	28.4.2021				
Author(s)	Petri Laari (LMF), Giuseppe Raveduto (ENG), Yannis Oikonomidis (SYN), Priit Anton (GT), David Mason (ROV), Francesca Santori (ASM), Alessio Cavadenti (ASM), Tommaso Bragatto (ASM), Francesco Bellesini (EMOT), George Xylomenos (AUEB-RC), Dmitrij Lagutin (AALTO), Filippo Vimini (LMF), Mikael Jaatinen (LMF)				
Responsible person	Filippo Vimini (LMF), <u>filippo.vimini@ericsson.com</u>				
Target Dissemination Level	Public				
Status of the Document	Completed				
Version	1.12				
Project web-site	https://www.sofie-iot.eu/				

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 779984.

Security: Public Date: 2

c Date: 28.4.2021

Status: Completed Version: 1.12

Summary of changes compared to previous version

Version	Major changes
1.12	Dataset links provided for pilots (when applicable)
1.11	Dataset information update for the Food Supply Chain and Decentralised Energy Data Exchange pilots
1.10	Datasets in Section 2 have been expanded to contain the following information:
	How the data will be made accessible
	How to reach partners producing this data
	Who is responsible for each dataset
	Who is responsible for maintaining/aggregating the data
	Is the dataset public or private
	Responsible party of data release

Security: Public Date

lic Date: 28.4.2021

Status: Completed Version: 1.12

1. Introduction

The main goal of the SOFIE project is to enable diversified applications from various application areas to utilise heterogeneous IoT platforms and autonomous things across technological, organisational and administrative borders in an open and secure manner, making reuse of existing infrastructure and data easy. SOFIE work is guided by four pilots in three different areas: food-chain, mobile gaming, and energy (two different use cases). These pilots will provide feedback on the architectural work and their requirements will be used to identify potential synergies between these different areas.

The pilots will create instances of the SOFIE framework and utilize them in the specific use cases. The pilots will collect relevant data, which among other things will be used to analyze the functionality of the implementation. We surmise that the data is useful for other projects that are creating IoT systems with similar setups.

The purpose of this Data Management Plan is to provide guidelines on how to collect. maintain, and further distribute collected data for external usage. This document specifies the data sets that will be collected from the four pilots implementing instances of the defined SOFIE architecture and framework. In each specification, the content of the data is described, as well as the format and location where they are stored and from where they can be retrieved after the project has ended.

Data that can compromise commercialization prospects or has inadequate protection of, e.g., personal information, shall not be published. The rest of the data will be deposited in an open access repository such as Zenodo (https://www.zenodo.org). When the data is related to a publication, it will be linked to it via OpenAIRE (https://www.openaire.eu).

WP5 takes the responsibilities of making sure the data release will happen accordingly to the plan

The rest of the document describes the collected data in more detail, and describes responsibilities related to the collection, securing and release of the data.

2. Description of Collected Data

This chapter describes the collected data from the different pilots in more detail.

Pilots manages their data procedure independently, but many commonalities are found when describing the procedure of making dataset public or internal. This decision is shared between the partners, which responsible person is the Responsible entity for dataset, and the PMC.

2.1 Food Supply Chain Pilot

Dataset name	Field Sensor Measurements					
Dataset description						
air temperature, air hu crop related data (lea Moreover, this data s indicator).	The data will be associated with time information and geospatial/location information provided					
Dataset status	Private					
Responsible entity for dataset	Dataset is owned by the end-user. SYN will contract a confidentiality agreement to make use of the dataset for development and testing purposes.					
Reaching partners producing data						
Security and privacy	/ considerations					
conditions and may b	ement include data relate to the product (i.e. grapes) and its growing be considered as private from the ownership point of view. Therefore, nto consideration if this data is to be considered as a potentially public					
Data release plan						
Release frequency	The dataset will not be released in public.					
Datatype name	Growing conditions measurements					
Data description	Micro-climate data (e.g. air temperature, air humidity, wind direction, wind speed, rain volume, rain intensity), soil and crop related data (leaf wetness, soil type, soil temperature, soil humidity, soil conductivity), timestamps					
Purpose of the data	To monitor product condition and safety in the field and calculate its growing degree days, data regarding the temperature, the wind speed and direction, the soil humidity and conductivity, as well as the environmental humidity and the solar radiation has to be collected.					

(so	=ÌE	Document:	H2020-I	OT-2017·	-3-779984-SO	FIE/D6.5 – I	Data Manage	ment Plan	
		Security:	Public	Date:	28.4.2021	Status:	Completed	Version:	1.12

Maintenance and aggregation of data	Responsible partner: SYN All collected data is stored in the database of the SynField IoT platform. Part of this data (e.g. growing degree days in specific time instances) is stored in the consortium ledger of the SOFIE platform.				
Relation to project objective	Part of this data will be encoded into the QR code labels attached on product packages to show information about growing conditions in the field.				
File types	.CSV				
(Data provider) Origin of the data	Size (xByte)	Access for Partners	Access for the public		
SynField IoT platform data	Up to 300KB per day per SynField node	Access will be provided, if needed for the project objectives.	Public access (on Zenodo platform) only to part of this data (aggregated/anonymized) : <u>https://zenodo.org/record/4392842</u> <u>https://doi.org/10.5281/zenodo.4392842</u>		

Dataset name	Transportation Sensor Measurements					
Dataset description	Data collected from IoT sensors mounted on a vehicle during transportation, i.e. temperature data and RFID data.					
Dataset status	Private					
Responsible entity for dataset	Dataset is owned by the end-user. SYN will contract a confidentiality agreement to make use of the dataset for development and testing purposes.					
Reaching partners producing data	oikonomidis@synelixis.com					
Security and privacy considerations						
Transportation sensor measurement data include product information which may be considered private from the ownership point of view. Therefore, this has to be taken into consideration if this data is to be considered as a potentially public dataset.						
Data release plan						
Release frequency	The dataset will not be released in public.					
Datatype name	Environmental conditions within transportation truck					

Data description	Temperature measurements, timestamps			
Purpose of the data	To monitor product condition during transportation.			
Maintenance and aggregation of data	Responsible partner: SYN Data is stored in the database of the Kaa IoT platform.			

Document:	H2020-IOT-2017-3-779984-SOFIE/D6.5 – Data Management Plan						
Security:	Public	Date:	28.4.2021	Status:	Completed	Version:	1.12

	Part of data is stored in the consortium ledger of the SOFIE platform.				
Relation to project objective	This data will be used to resolve potential disputes between members of the supply chain. Also, part of this data will be encoded into the QR code labels attached on product packages available on the market.				
File types	.CSV				
(Data provider) Origin of the data	Size (xByte)	Access for Partners	Access for the public		
Transportation IoT platform data	MBs per month	Access will be provided, if needed for the project objectives.	Public access (on Zenodo platform) only to part of this data (e.g. aggregated/min/max values) : <u>https://zenodo.org/record/4392842</u> <u>https://doi.org/10.5281/zenodo.4392842</u>		
Datatype name	Presence of boxes within truck body				
Data description	RFID tags, timestamps				
Purpose of the data	To monitor presence of boxes carrying products within the transportation vehicle and refer which actor has their responsibility as they are transferred from the field to the supermarket.				
Maintenance and aggregation of data	Responsible partner: SYN Data is stored in the database of the Kaa IoT platform. Part of data is stored in the consortium ledger of the SOFIE platform.				
Relation to project objective	This data will be used to verify responsibility of assets as they move over the supply chain and resolve potential disputes between members of the supply chain.				
File types	.CSV				
(Data provider) Origin of the data	Size (xByte)Access for PartnersAccess for the public				
Transportation IoT platform data	MBs per month	Access will be provided, if needed for the project objectives.	Public access (on Zenodo platform) only to part of this data (e.g. aggregated/min/max values) : <u>https://zenodo.org/record/4392842</u> <u>https://doi.org/10.5281/zenodo.4392842</u>

Reaching partners producing data	dpo@asmterni.it e.mancinelli@emotion-team.com					
Security and priva	acy considerations					
	f the collected information about driving and charging habits, but also the n could have an impact on the privacy of the user.					
Data release plan						
Release frequency	Every 6 months					
Responsible for data release	ASM Terni S.p.A. and Emotion SRL					
Datatype name	Voltmeter/Current meter/Custom recordings/EV data					
Data description	Voltmeter/Current meter/Custom recordings/Charging station data/EV data (battery state of charge, residual autonomy, minutes to full charge, doors car state, engine car state)					
Purpose of the data	To control the charging behaviour of an electric vehicle (EV) it is important to know the current state of charge of the EV battery, but also the current state of the power grid. A forecast about the use of the EV and the needed energy, based on historical information, can also use information about the driver's behaviour.					
Maintenance and aggregation of data	Data are stored in local servers					
Relation to project objective	Multiple EV's will be controlled in terms of their state of charge and their charging schedule. The schedule takes the current state of the power grid into account. Therefore, it is important to measure the grid state. To calculate a charging plan it is important to make a forecast of the user's behaviour. For this reason, information about the user's behaviour needs to be collected.

2.3 Decentralised Energy Data Exchange Pilot

The pilot makes decentralized data exchange possible without storing the metering data itself. It is designed to provide secure and flexible connections between different parties. Private datasets are not meant for sharing. The public datasets require more wide-spread deployment of the federation adapters in real-life, which has not happened yet. Currently this pilot does not collect and publish data.

The private datasets are not for sharing. The tables in this chapter describe the content of those datasets. Private datasets are managed by the participants directly.

2.4 Context-Aware Mobile Gaming Pilot

Mobile Gaming pilot is an explorative research project. We aim to identify and understand use cases for Distributed Ledger Technology (DLTs) and Internet of Things (IoT) in gaming and test their business opportunities. The results from the pilot are published as open source and as part of SOFIE work package documentations. This pilot does not collect and publish data, so no public datasets are available.

Dataset name	Game content DNA					
Dataset description	Data written to the blockchain for in-game content. This will enable swapping or buying with other players (e.g. characters weapons, equipment, parts), leveraging DLTs to provide playe ownership of the asset, an open market for trading transactions transparency and consistency of asset attributes and transactions. This will also allow mini-games to be built on top o the game content.					
Dataset status	Private					
Responsible entity for dataset	Rovio					
Security and privacy con	siderations					
This information will be tran data will contain no person		nsumers and potentially held cially sensitive data.	on a public DLT. This			
Data release plan						
Release frequency	Once	Once				
Responsible for data release	Rovio					
Datatype name	Game content DNA					
Data description	Game content DNA					
Purpose of the data	The unique attributes of the game content.					
Maintenance and aggregation of data	Smart contracts will be used to tokenise the content and store it on blockchain					
	A private channel on a permissioned blockchain will used for maintaining and aggregating data					
Relation to project objective	Key content data for core game and mini-games.					
File types	.json					
(Data provider) Origin of the data	Size Access for Partners Access for the public		Access for the public			
Rovio Sofie	About 1kB per transaction	Access will be provided, if needed for the project objectives.	Access using valid identity and through the Mobile game application.

3. Resources Required for Storing Data

Collecting the data and storing it requires both working hours and data storage that create cost for the partners. Also other things e.g. licensing may create costs. In this section, the potential cost targets are described for each of the pilot projects.

Food Supply Chain pilot: The cost for data collection and storage that has been observed to be needed during the project includes the virtual machines that host the various storage services (i.e., databases) which amount approximately one thousand euros per year. If this data is stored on partners infrastructure (SYN and OPT), then this cost is eliminated. The process of data collection and storage has been automated; thus, the working hours needed are mainly for maintenance purposes. Data access will not be public as mentioned in the dataset's description in section 2. However, part of the pilot data (anonymized, aggregated) will be uploaded on Zenodo platform for replication and research purposes.

Energy pilots (both use cases): The cost of making data accessible also depends on the amount of data, the cost of long term storage solution and the effort required for publication. An estimation cannot be delivered at this time, as too many influencing factors are unknown at the moment.

The responsibility for the long term data archiving and publication is not specified yet.

Context-Aware Mobile Gaming pilot: The cost of making data accessible also depends on the amount of data, the cost of long term storage solution and the effort required for publication. An estimation cannot be delivered at this time, as too many influencing factors are unknown at the moment.

4. Data Handling and Security

Each of the pilots have different security requirements for their data. Although all pilots follow the generic rules, they still have some specific issues to be considered from their perspective. In the following, data security for each pilot project is described with their own requirements.

Food Supply Chain pilot:

As mentioned in section 2, under dataset's description, datasets will not be made publicly available due to commercially sensitive product information. However, partial trial data (anonymized and aggregated) will be uploaded on Zenodo platform for replication and research purposes before the end of the project.

Each pilot partner will be responsible for its own generated data, including storage, data recovery, and transfer.

To facilitate a good level of collaboration between the consortium's partners, pilot test data repositories will be available at Synelixis SynField cloud platform.

Energy pilots (both use cases): Each partner is responsible for recoverability of their own generated data. The assessment of security risks, which may arise, with the content of gathered data will be done by the entity who is collecting the data.

Context-Aware Mobile Gaming pilot: The data security complies with Rovio's privacy notice <u>http://www.rovio.com/privacy</u> and terms of service <u>http://www.rovio.com/terms-of-service</u>.

5. Ethical Aspects

The SOFIE partners will comply with the GDPR legislation. Ethical principles are described in more detail in Section 5.1 of the Annex 1 to the SOFIE Grant Agreement (Description of the Action, Part B).
