

Yokis Pro

QUICK GUIDE

MATERIAL NECESSARY TO USE "YOKIS PRO":

1x TABLET ANDROID (Version 4.4 or higher) equipped with an OTG port (which can supply power)
1x YOKEY - 5454491: with its USB Adapter - Micro USB

ACCESSORY MATERIAL:

YOKISHUB – 5454495: Radio Hub for private home control and scenario management through the YnO app

Page 67

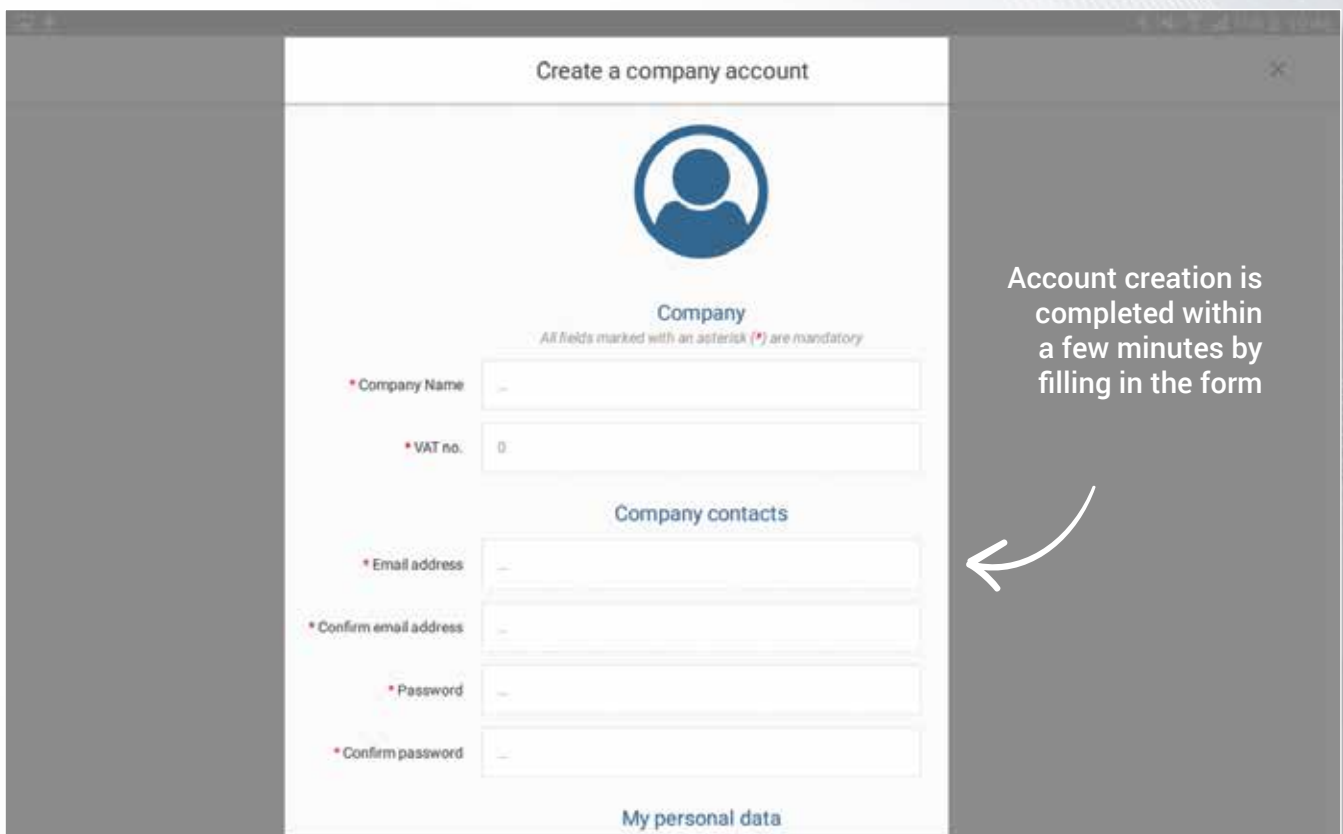

First connection and creation of the Company Account

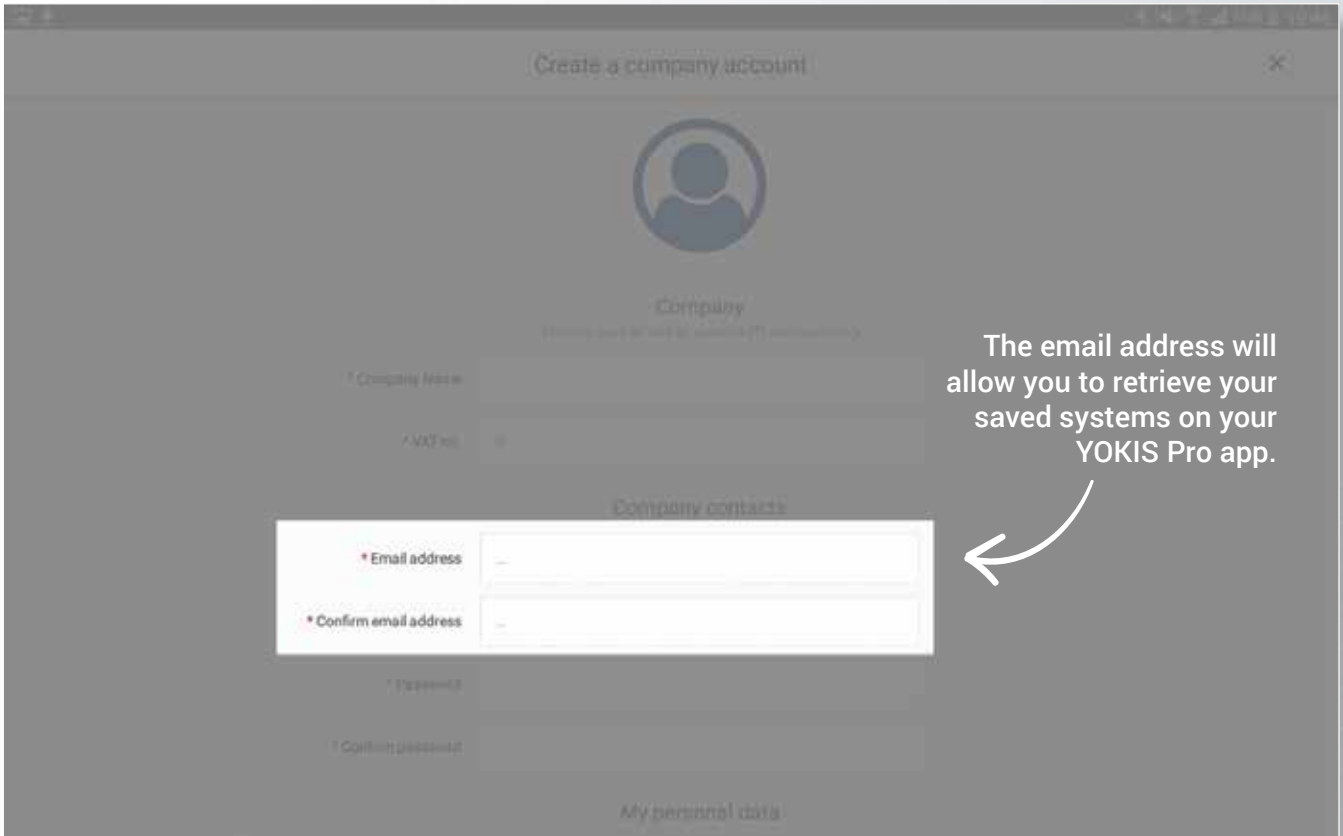

At the first use of the YOKIS Pro app it is imperative to create a YOKIS Pro company account. This account is essential for protecting your systems and for saving a copy in the YOKIS Cloud.

NOTE: It is important to be connected to the Internet when creating the account and/or saving the systems.

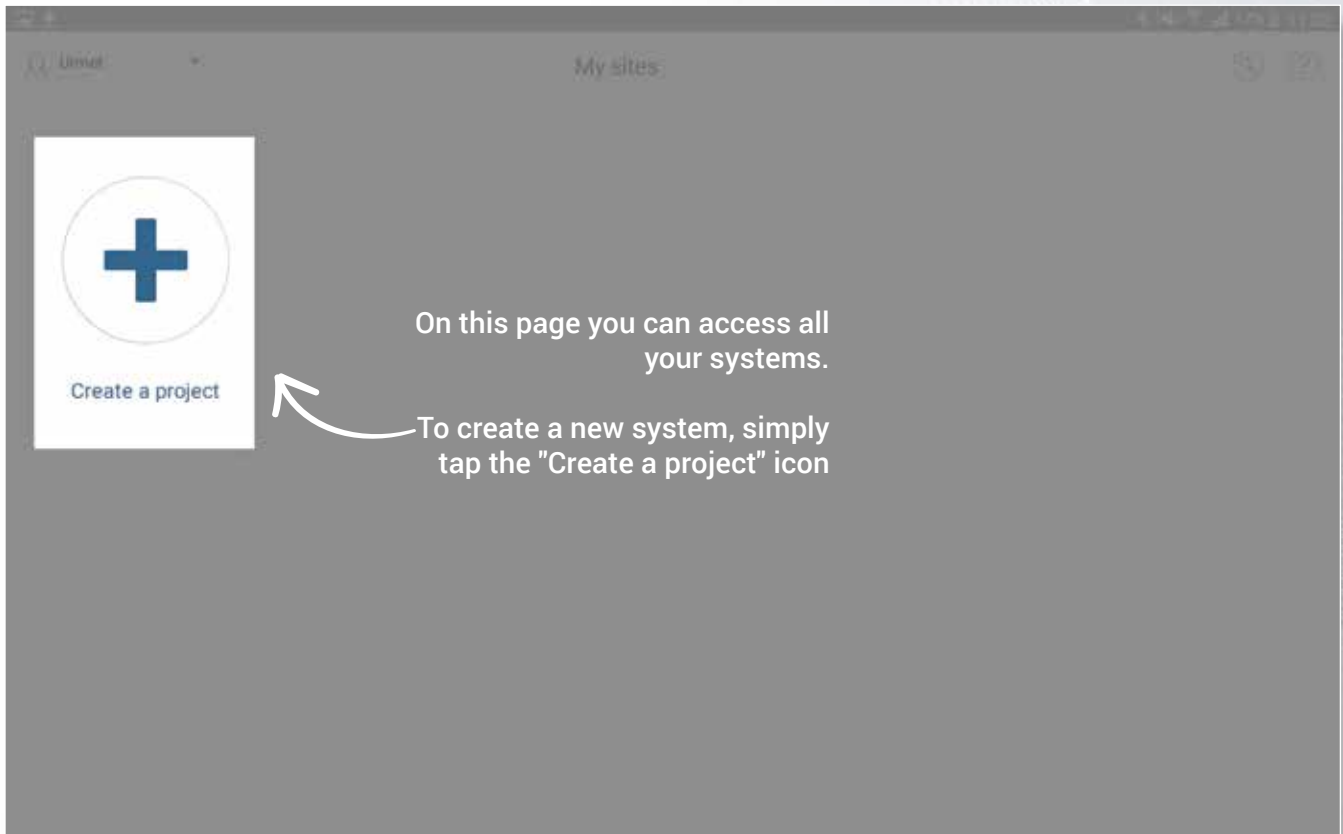

Account creation is completed within a few minutes by filling in the form.

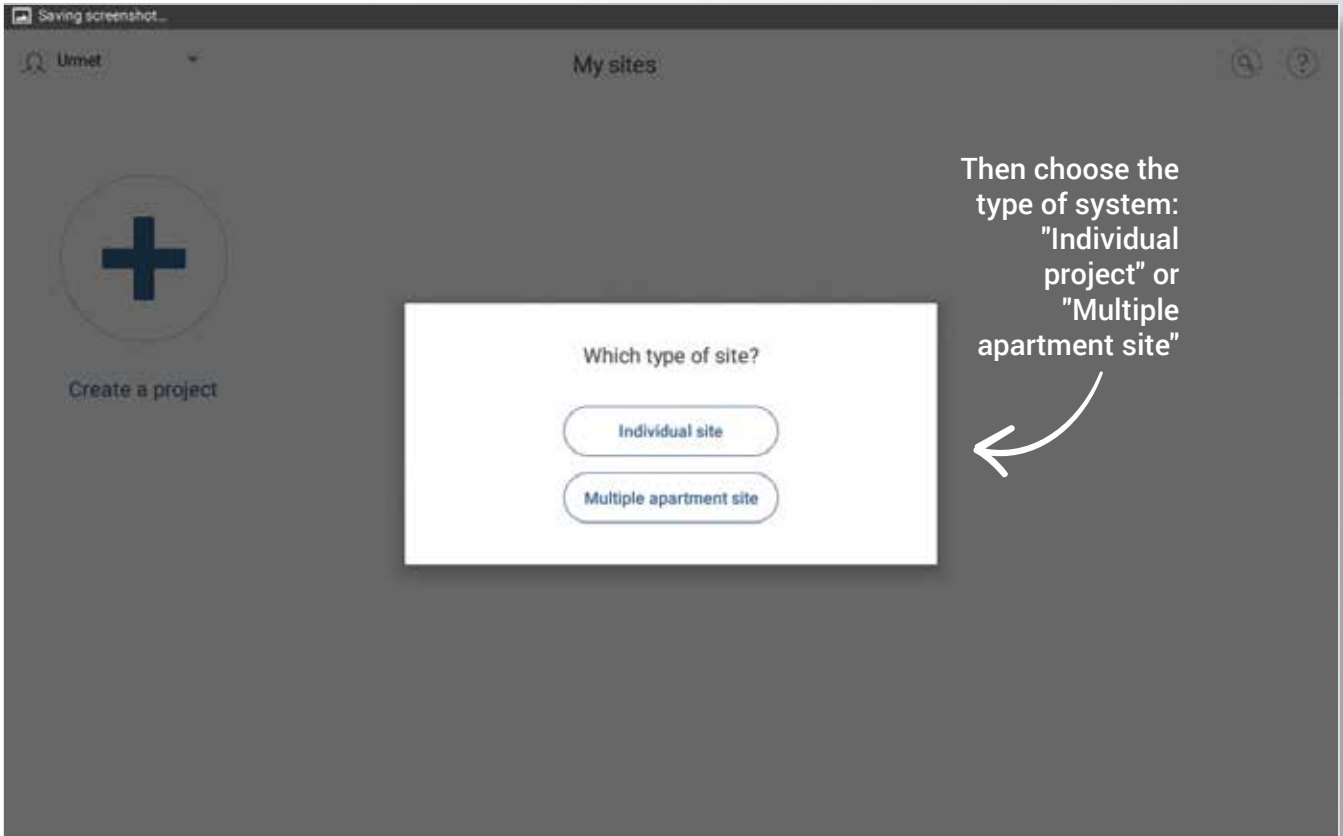

Creating your first system

To start working, you need to create a first system.

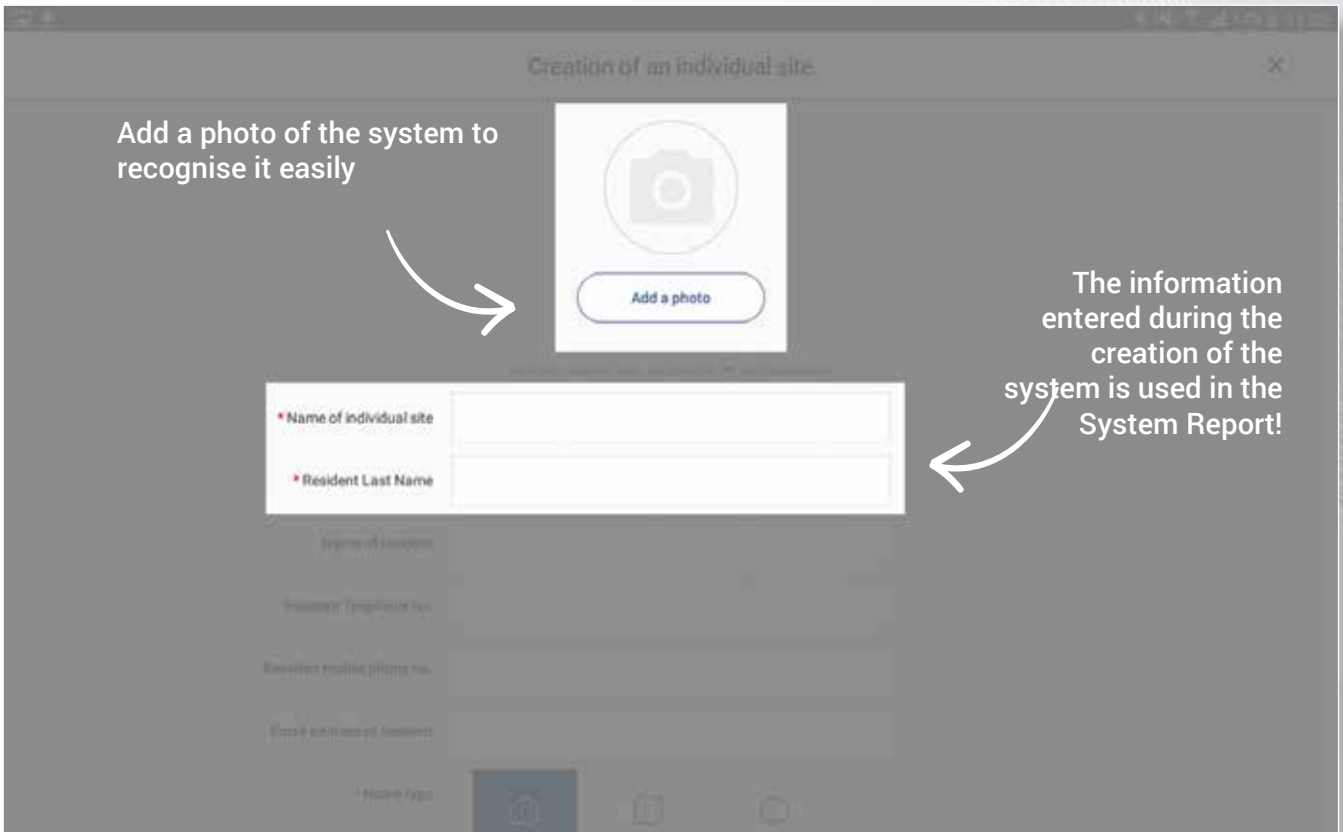

It can be an **Individual project** or **Condominium project**.

NOTE: The creation of a condominium project (several apartments in the same building, terraced houses, etc.) makes it possible to organise all the facilities in the same "folder", thus simplifying display.

At this point, you have to enter information about your system in the appropriate form.

NOTE: this information will be re-used to generate the "System Report" in PDF format. It is important to properly complete the form. However, it is possible to change the system information at any time using the "Details" button.

The YOKIS Pro interface

The screenshot shows the 'Dashboard' of the YOKIS Pro interface. At the top, it says 'Welcome to your work area!' and 'To set up the system you need to go through 3 configuration steps.' Below this, three circular icons represent the steps: 'Map and Modules', 'Control points', and 'Scenes'. Each icon has an arrow pointing to a text box below it. The first text box says 'Step 1: Draw the layout of the apartment and create the Radio Bus'. The second text box says 'Step 2: Define all the control points'. The third text box says 'Step 3: Propose scenarios from the library to the customer'. In the top right corner, there is a 'Details' button with an information icon.

Dashboard

Welcome to your work area!

To set up the system you need to go through 3 configuration steps.

Map and Modules
Step 1

Control points
Step 2

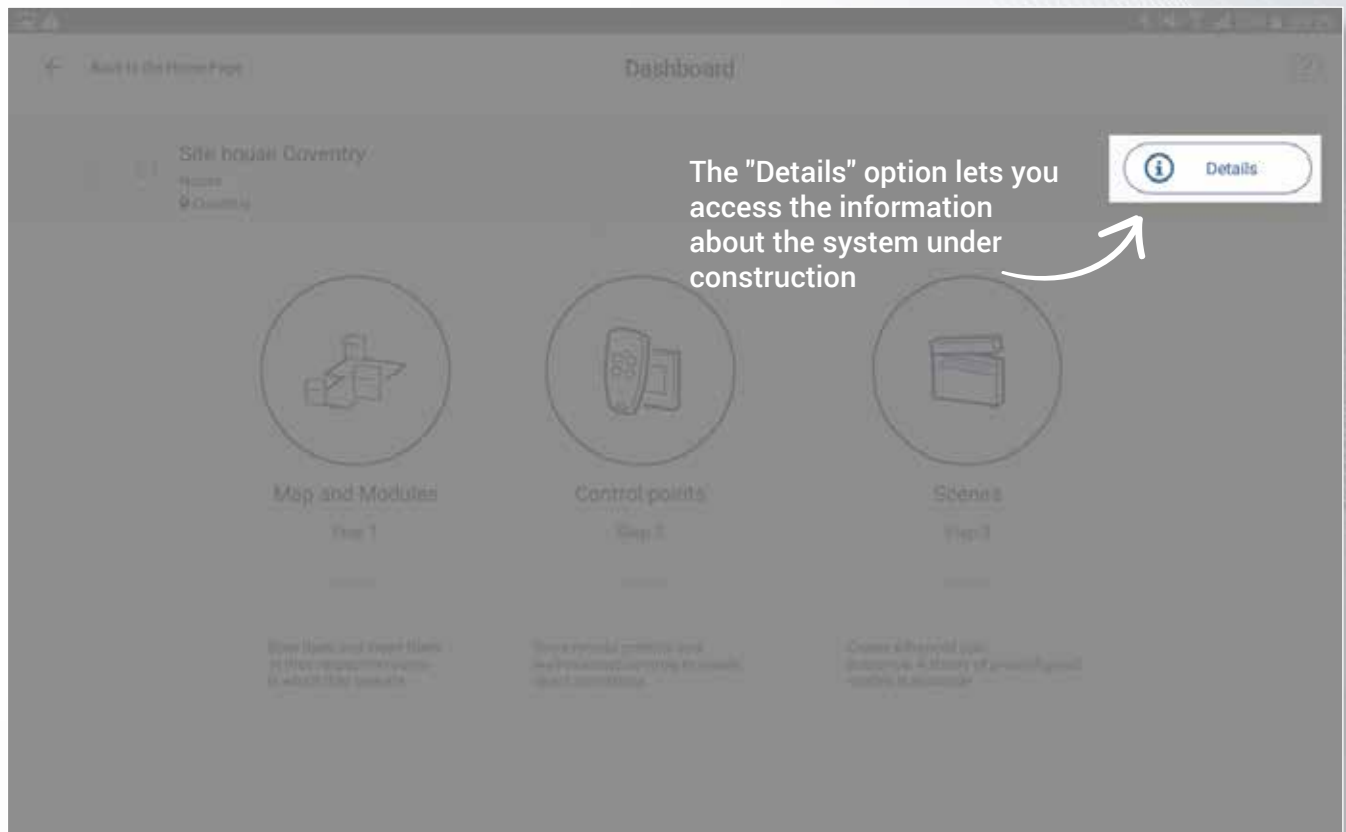

Scenes
Step 3

Step 1: Draw the layout of the apartment and create the Radio Bus

Step 2: Define all the control points

Step 3: Propose scenarios from the library to the customer

Details

This screenshot is similar to the one above, but it highlights the 'Details' button in the top right corner. An arrow points from the text 'The "Details" option lets you access the information about the system under construction' to the 'Details' button. The three configuration steps are visible but dimmed in the background.

Dashboard

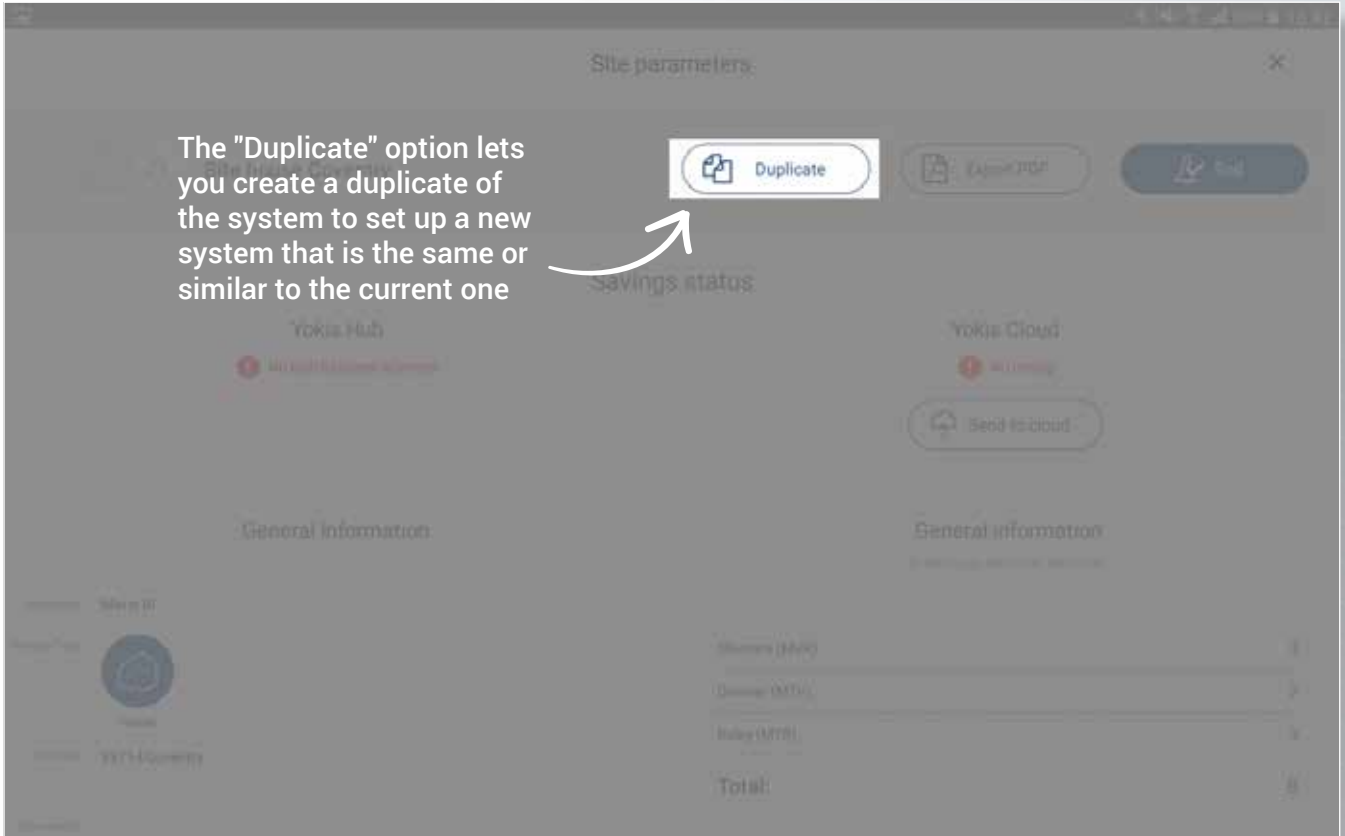

The "Details" option lets you access the information about the system under construction

Map and Modules
Step 1

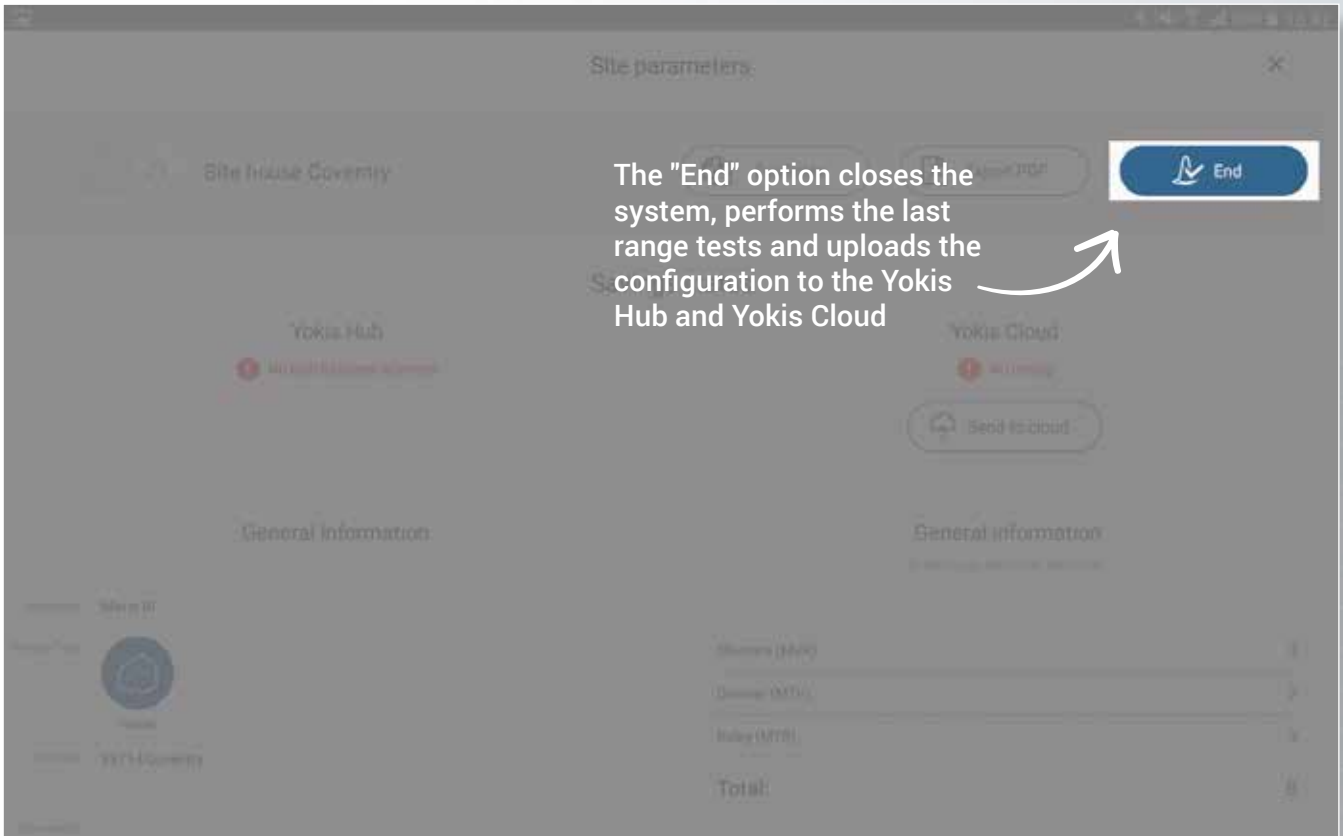

Control points
Step 2

Scenes
Step 3

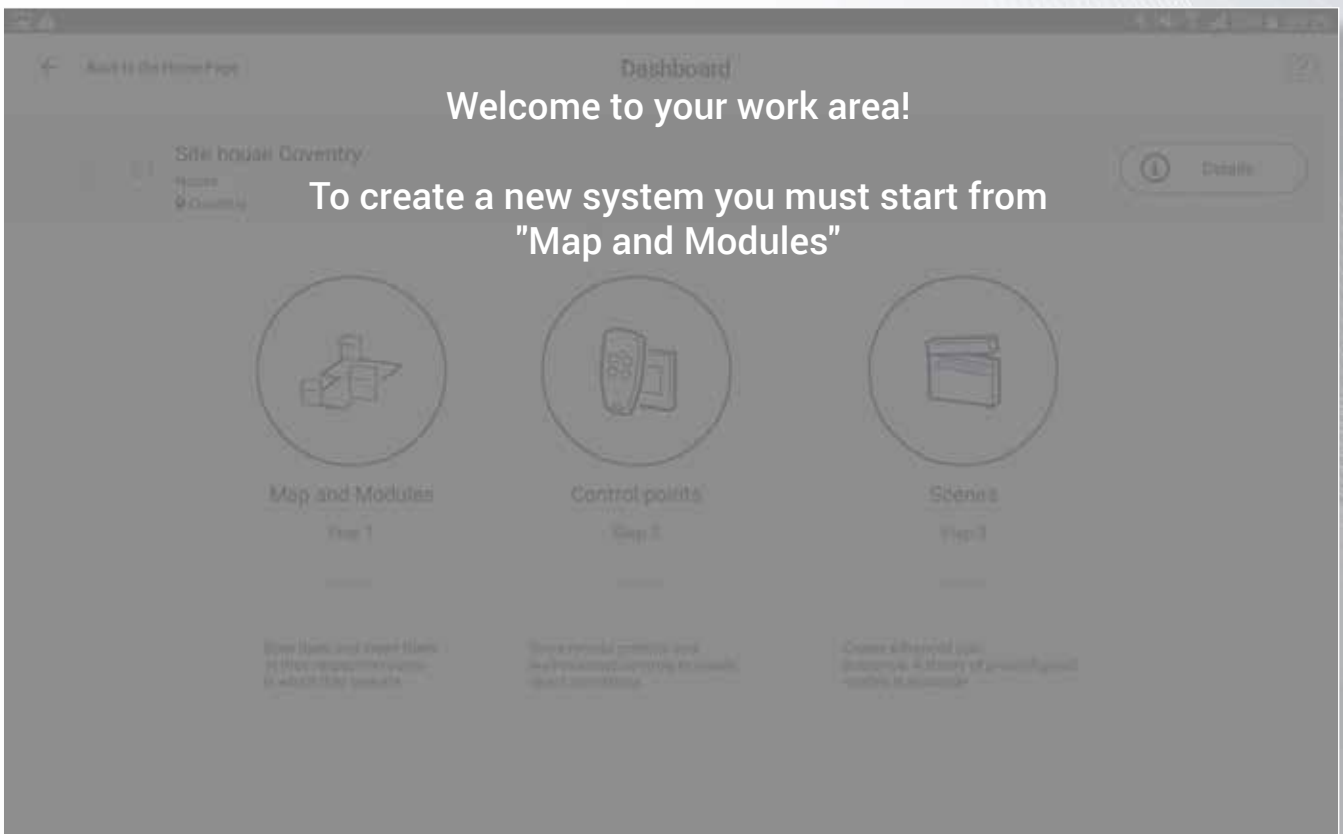

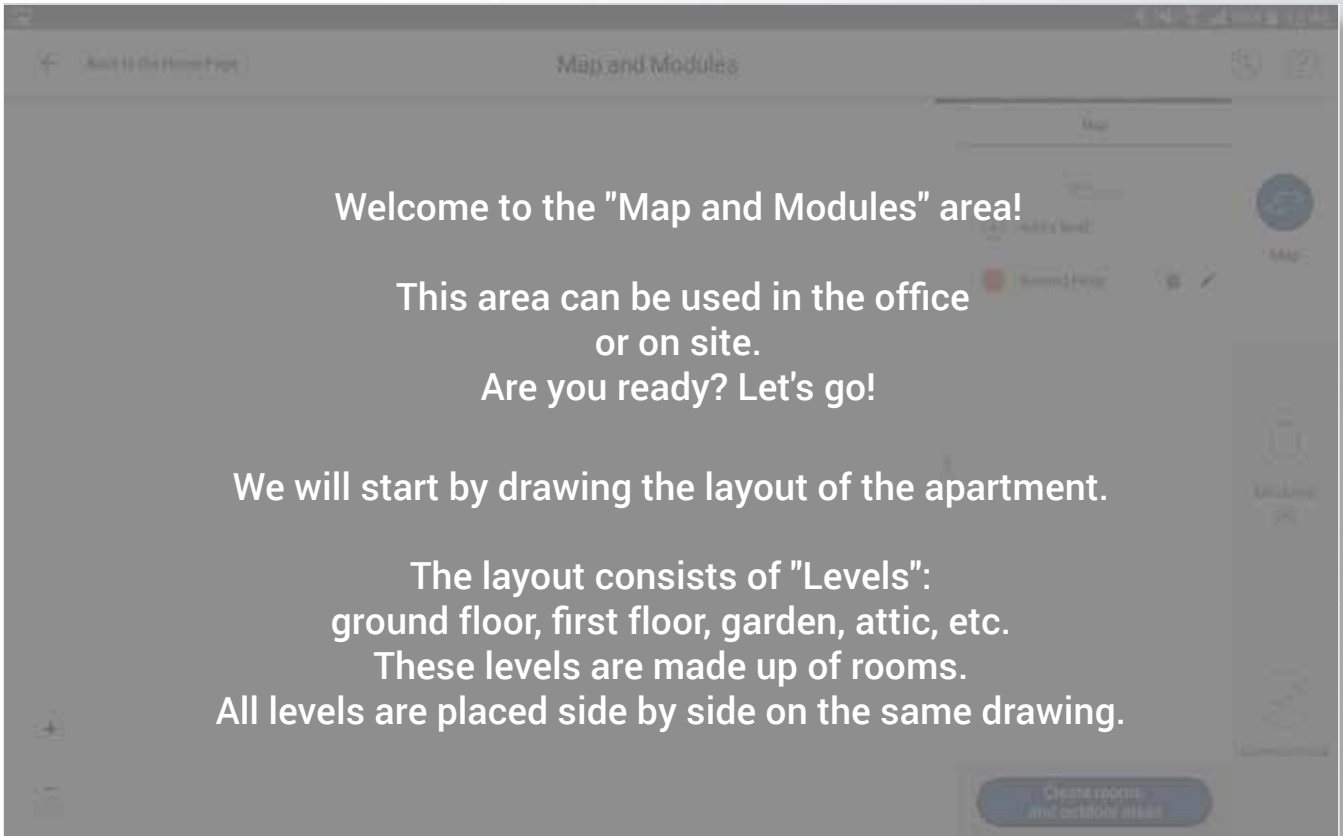

NOTE: In the copied system the detected modules become "dummies".

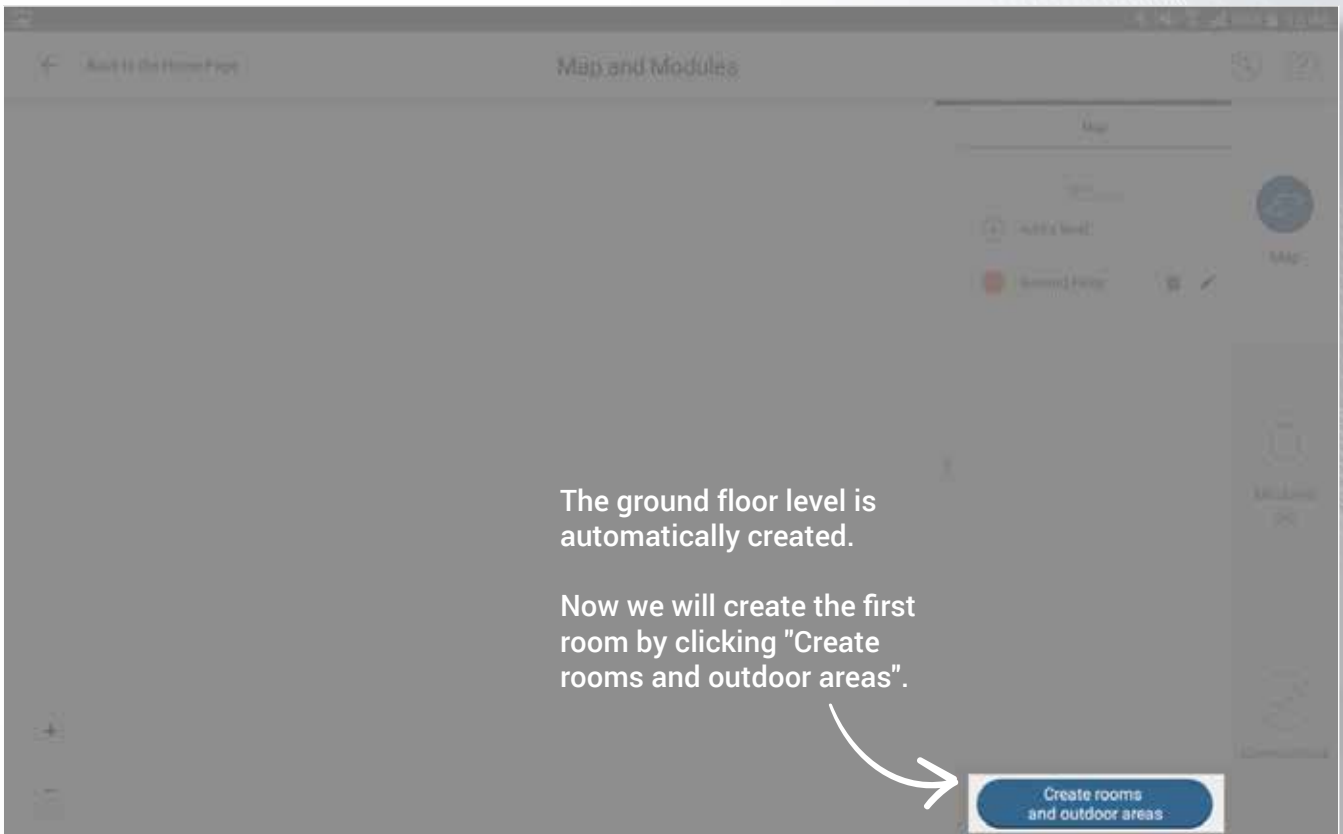

Preparation of the system

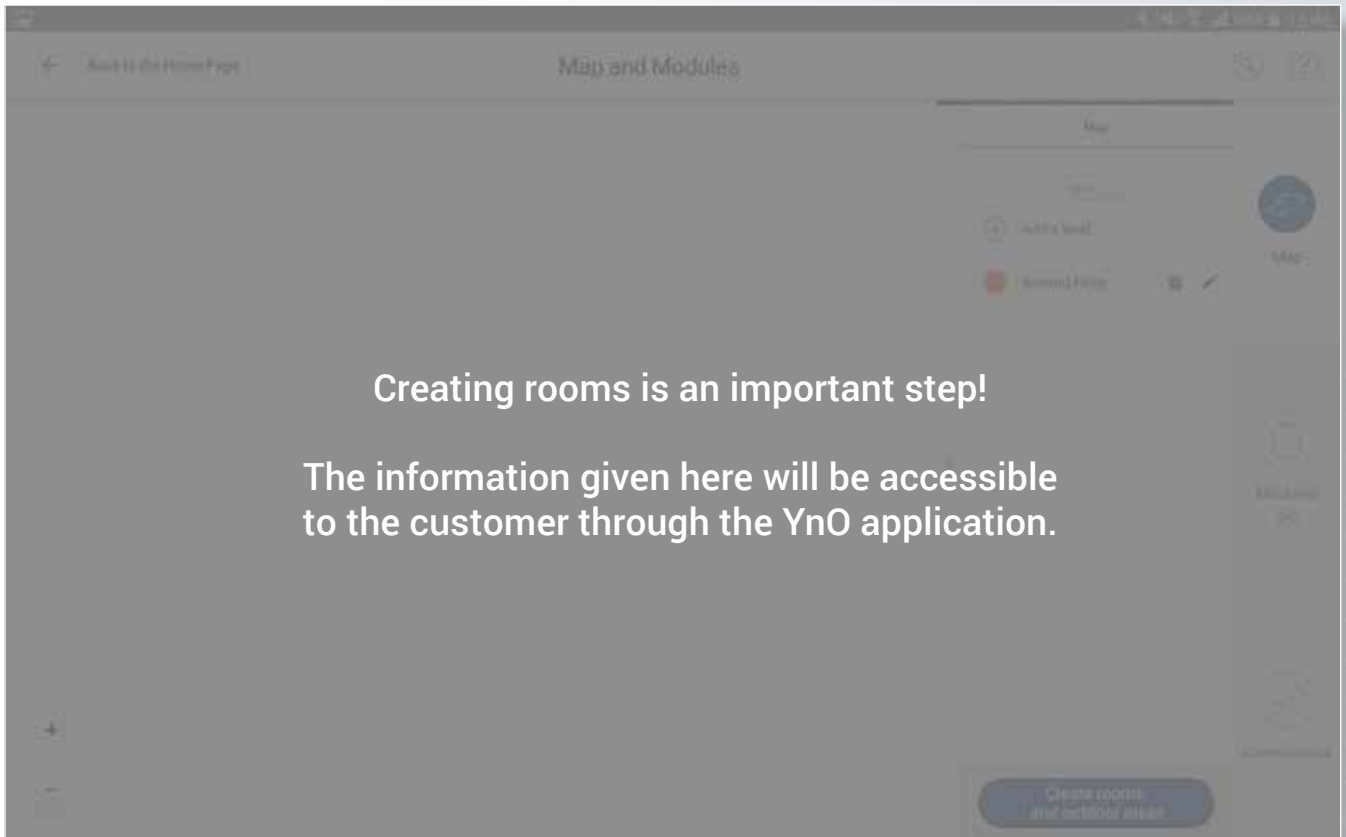

Preparation of the system

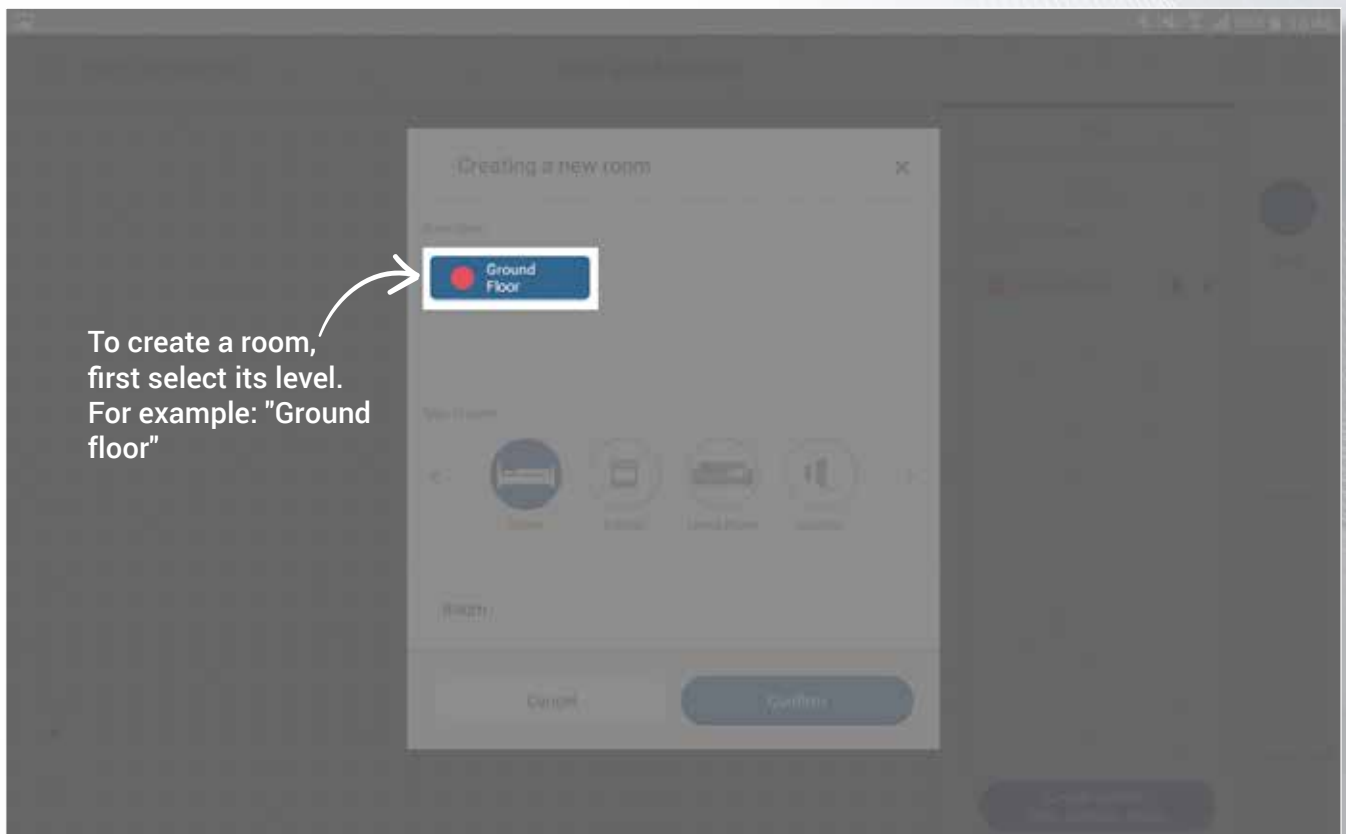

The layout of the apartment

Preparation of the system

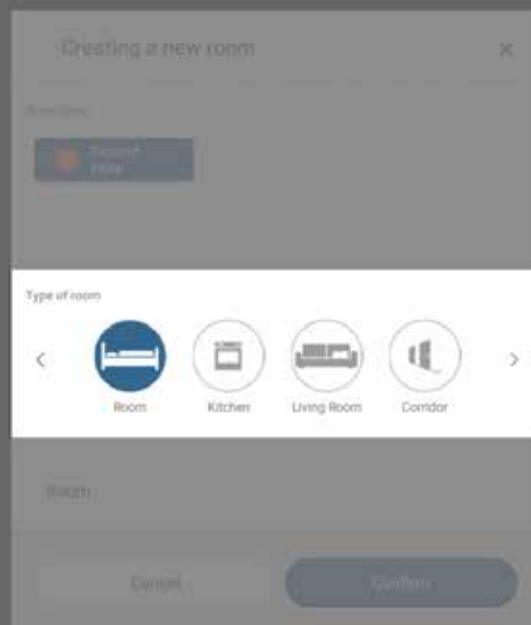

Define the rooms

Then select the room type.

During this phase, the type of room must be respected.

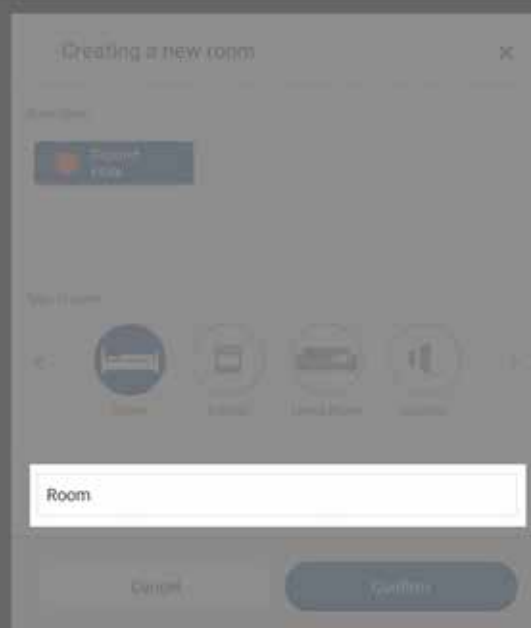

For example, a master bedroom is handled differently from a child's room.

Choosing the correct room types will then allow you to use the scenario library in automatic configuration. This library will also be accessible to the customer through the YnO application.

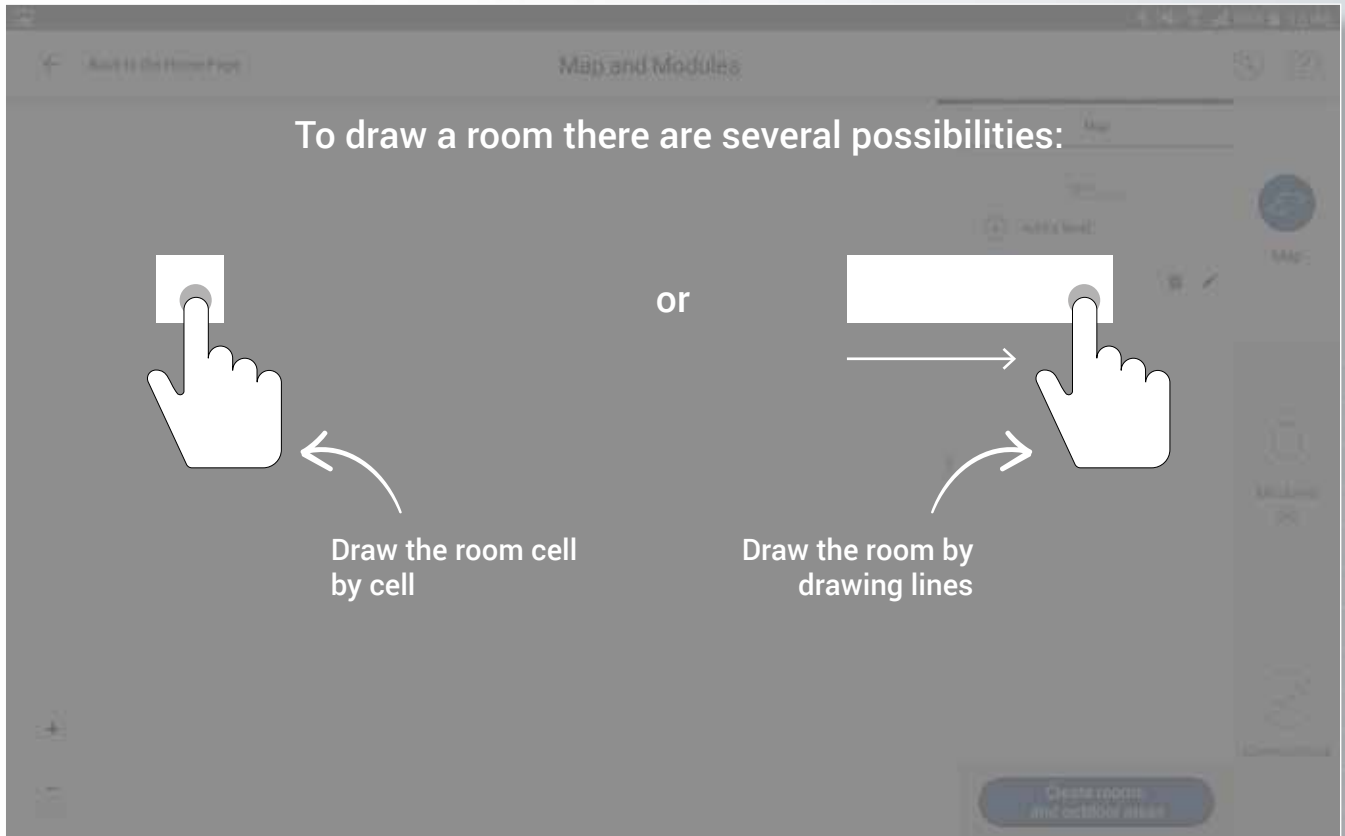

Finally give a name to the room.

Customise the names, for example: "Matthew's Room".

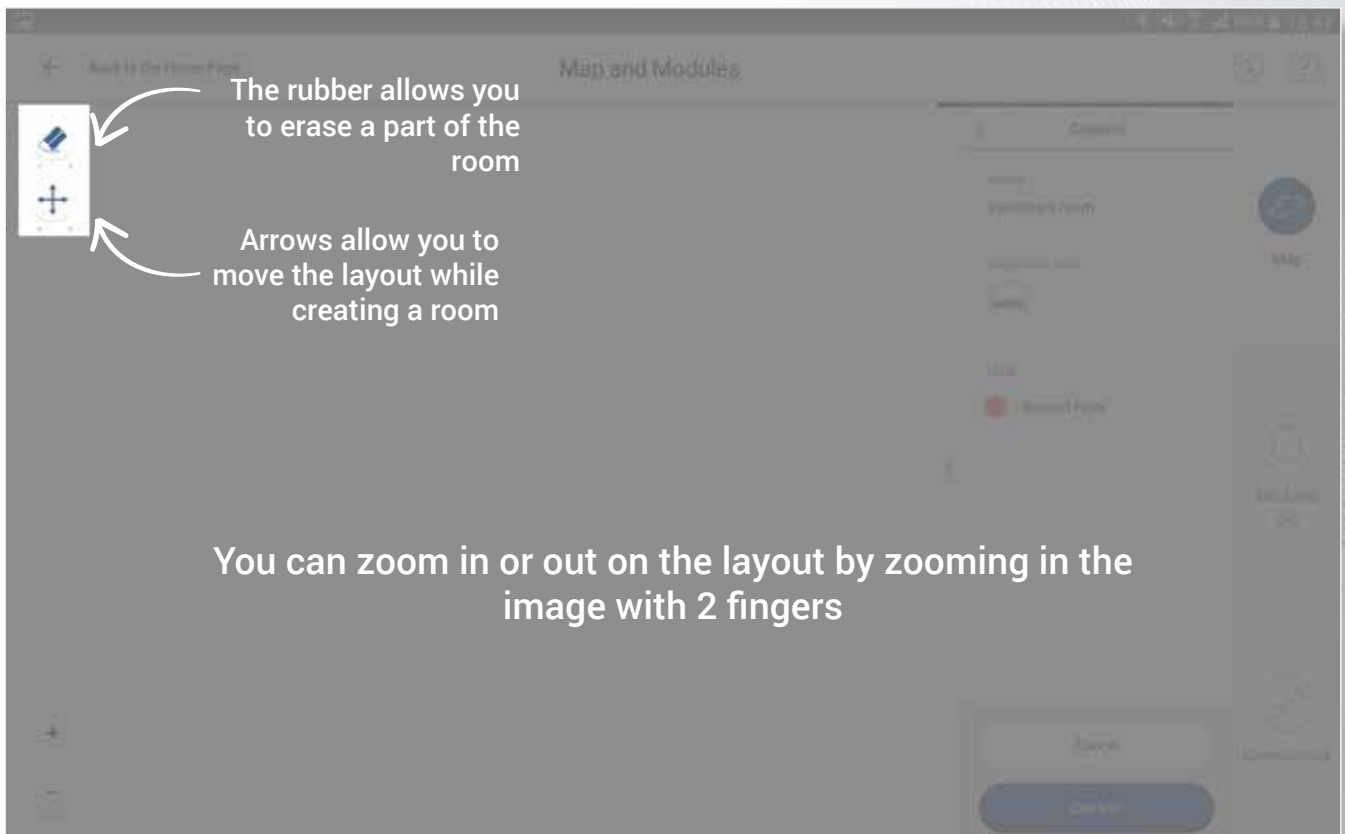

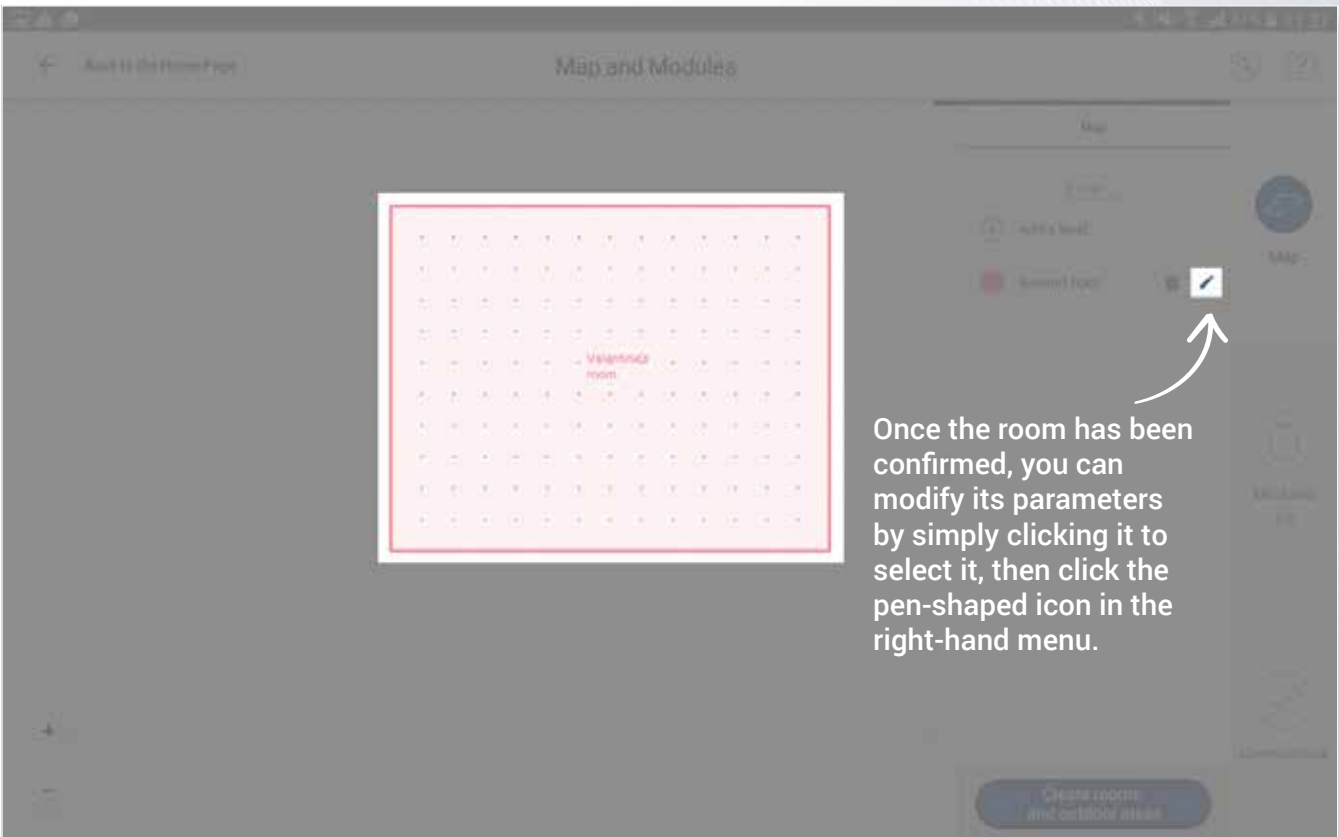

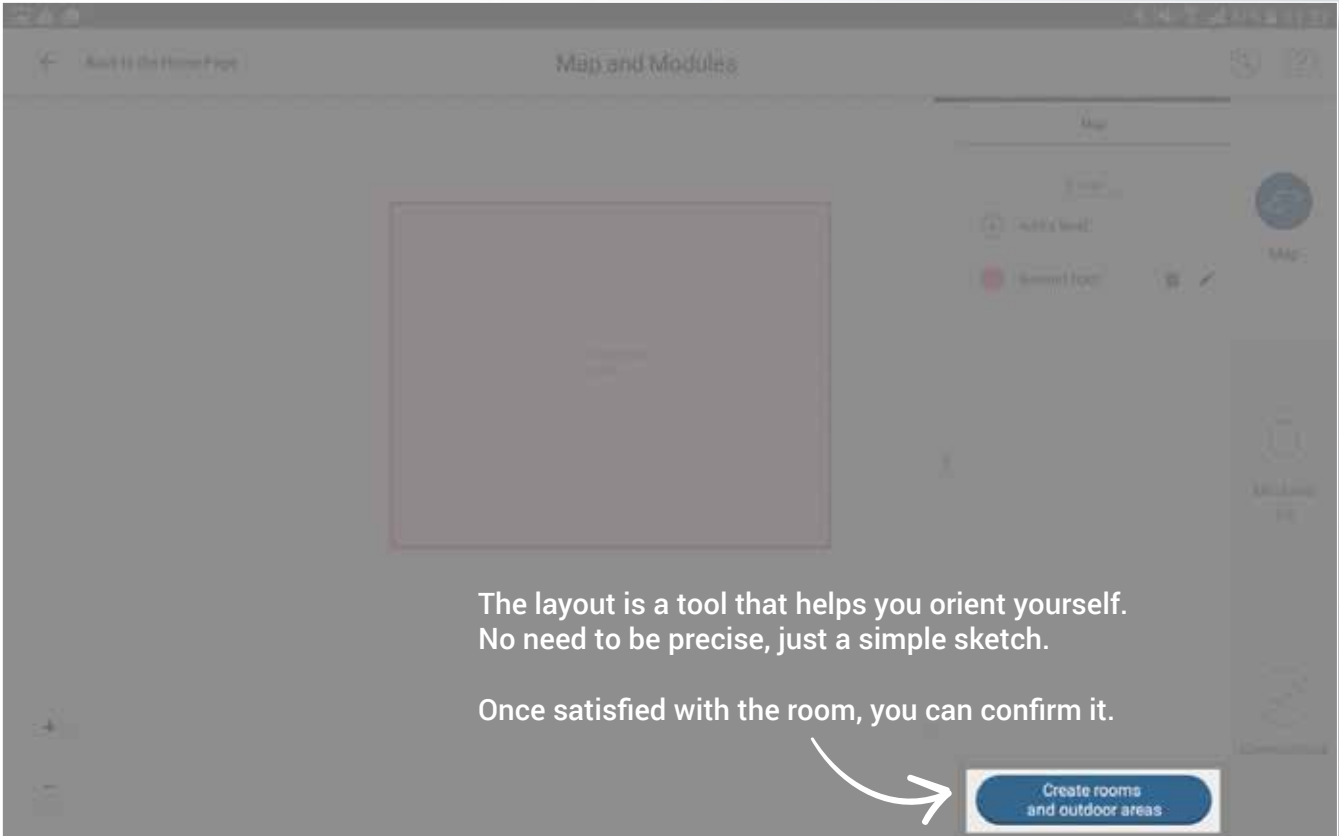

Preparation of the system

Draw the rooms

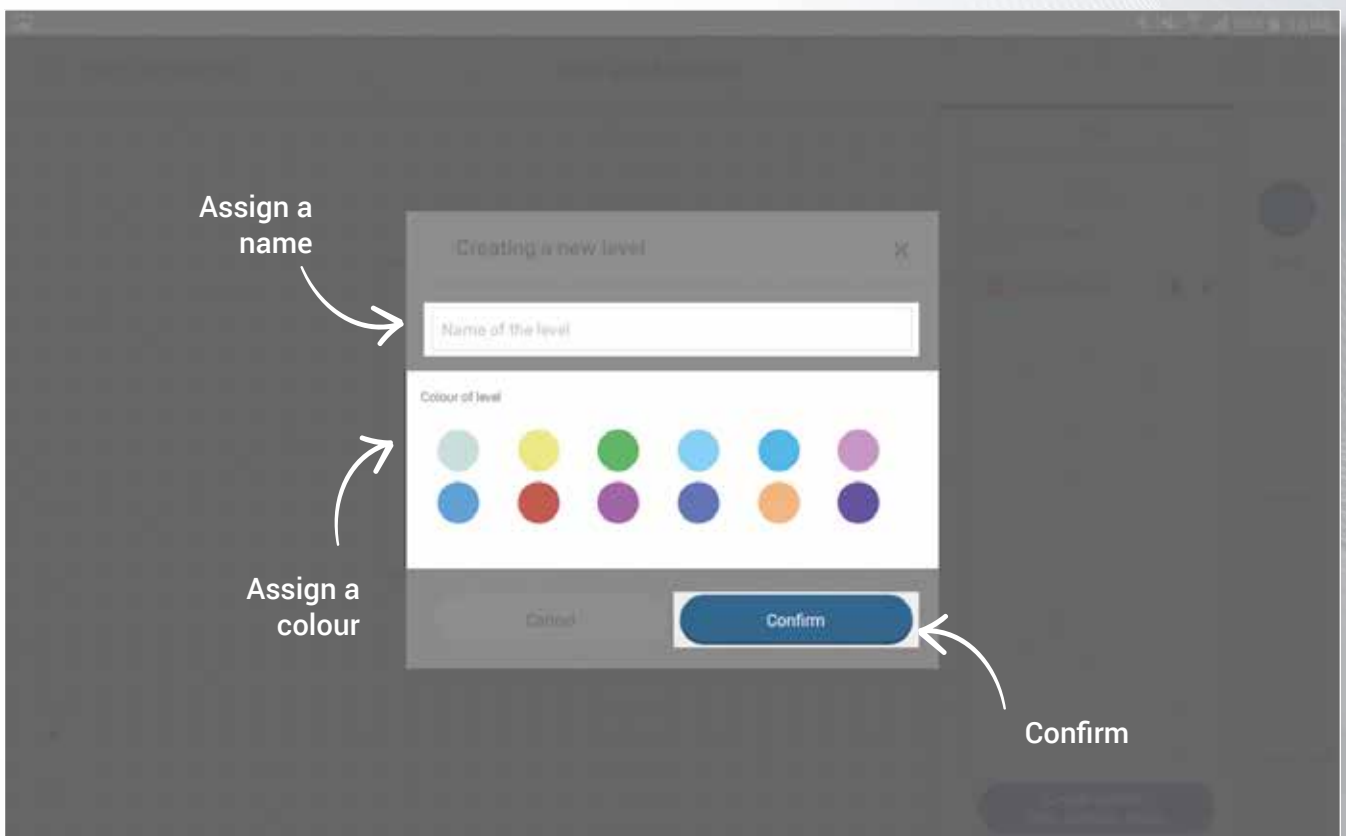

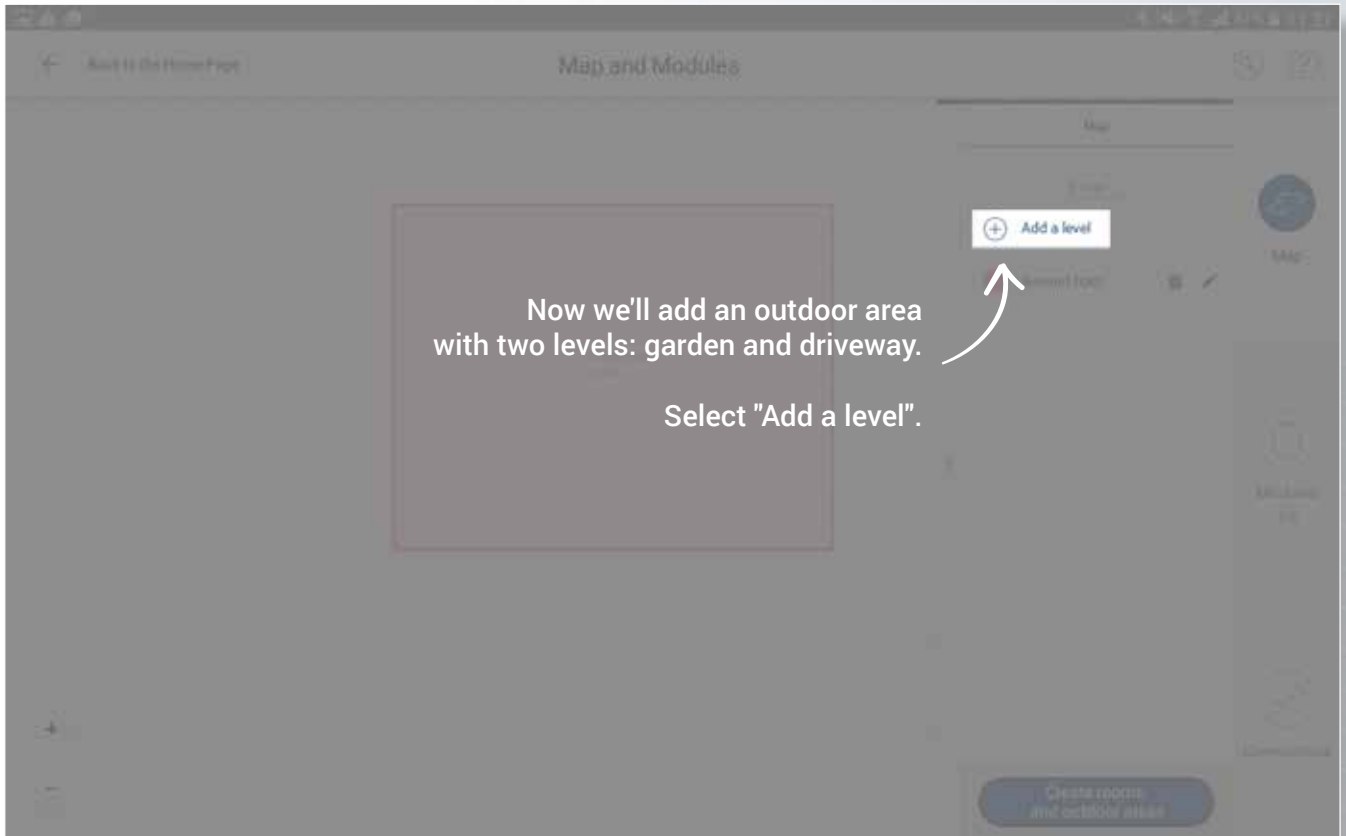

NOTE: To define a room, you must **draw a full rectangle**. Drawing just a border does not allow you to create a room.

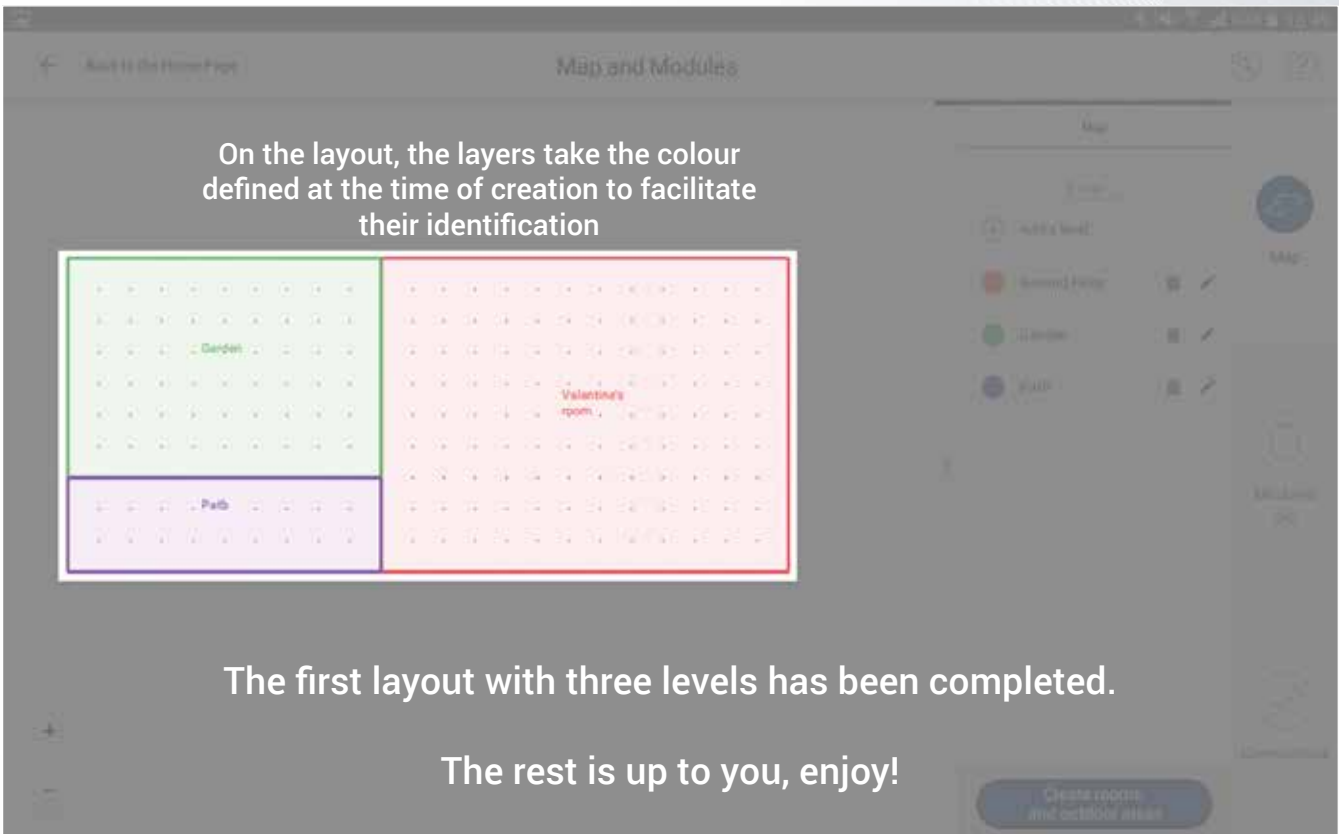

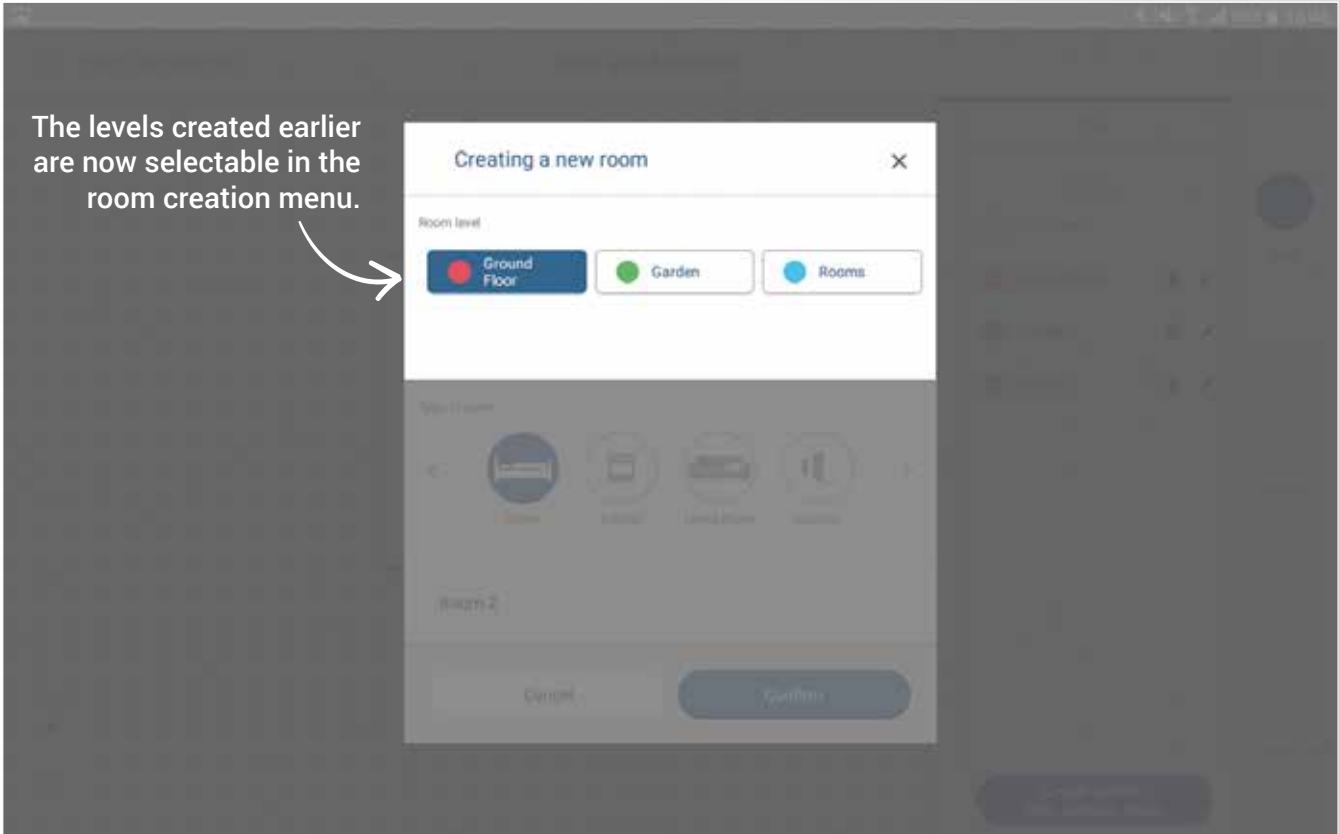

Preparation of the system

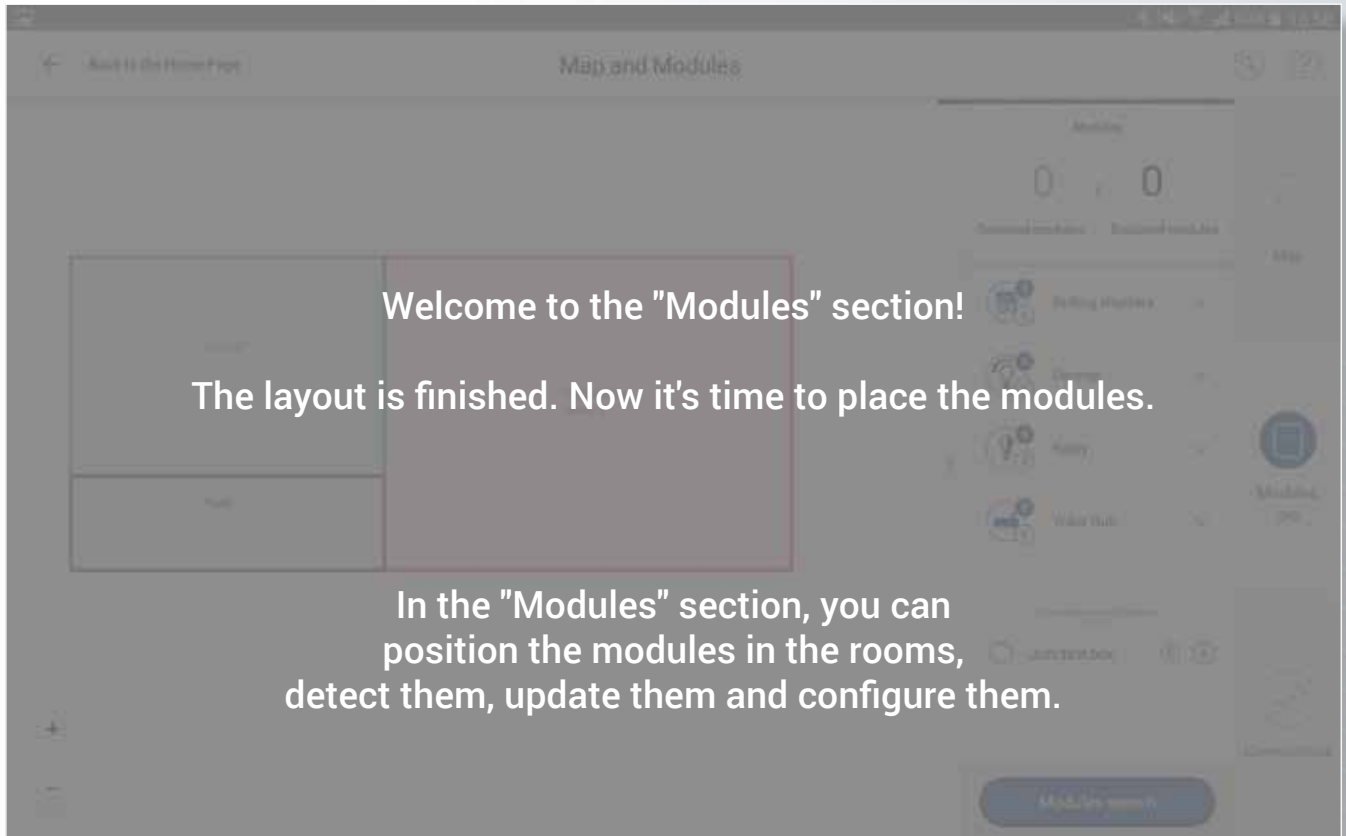

Define a new level

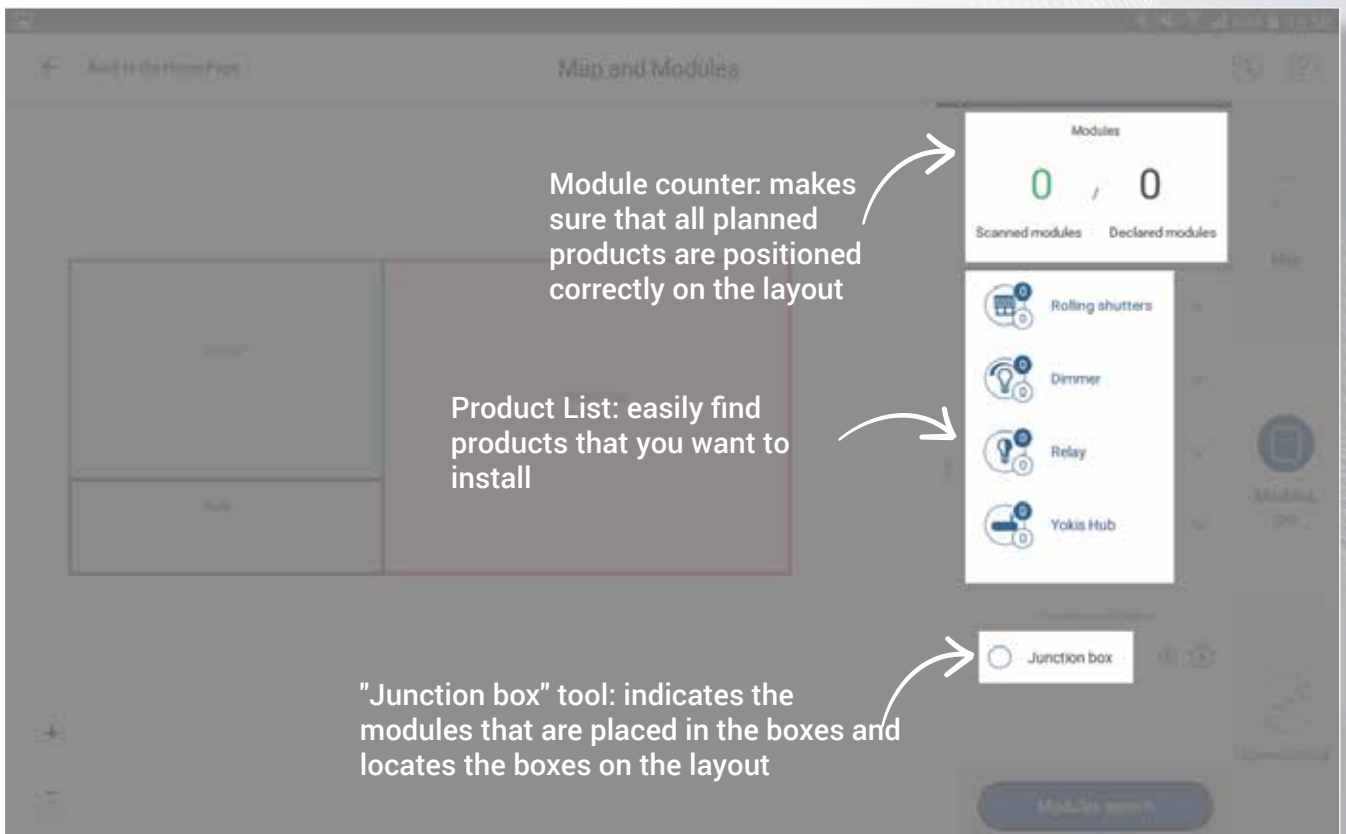

The system's radio modules

Place the modules on the layout

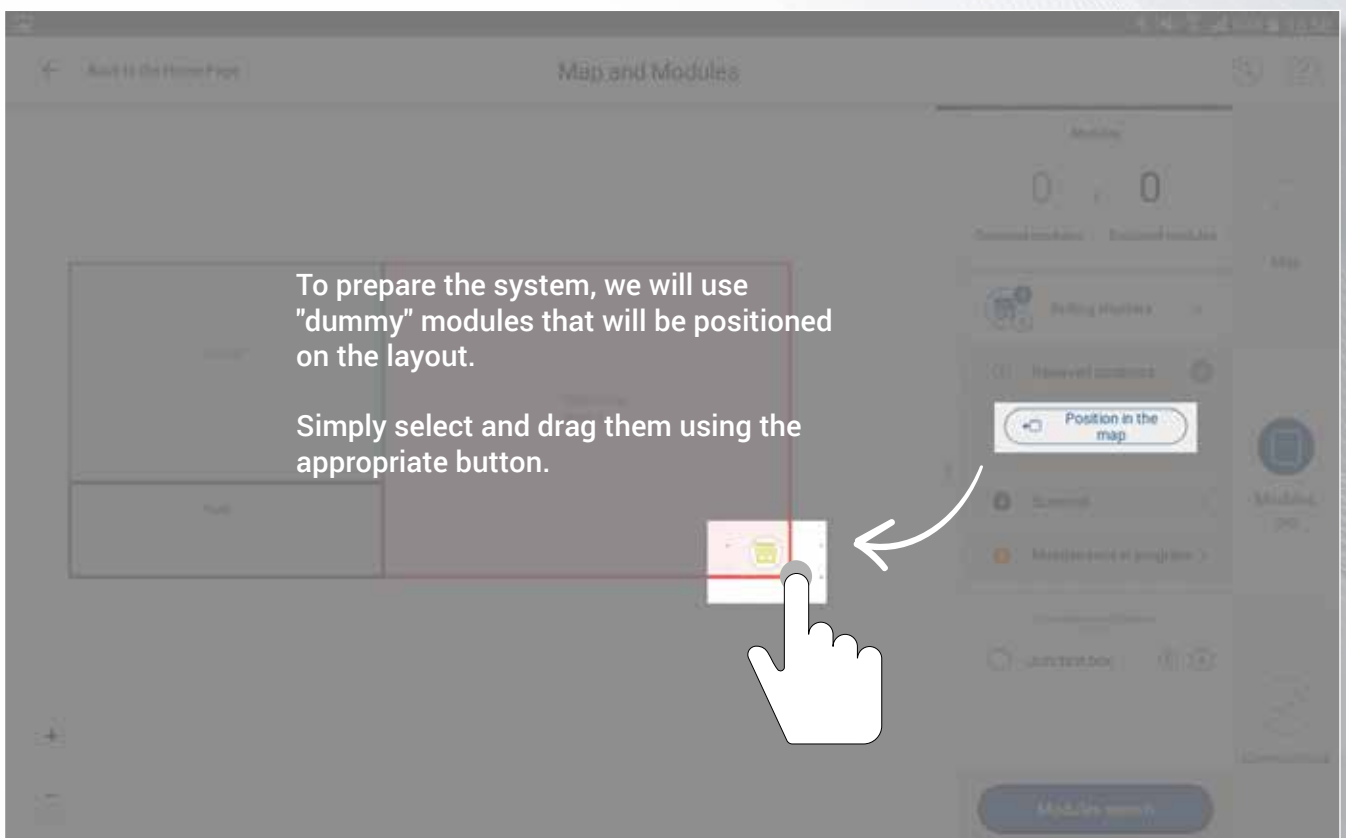

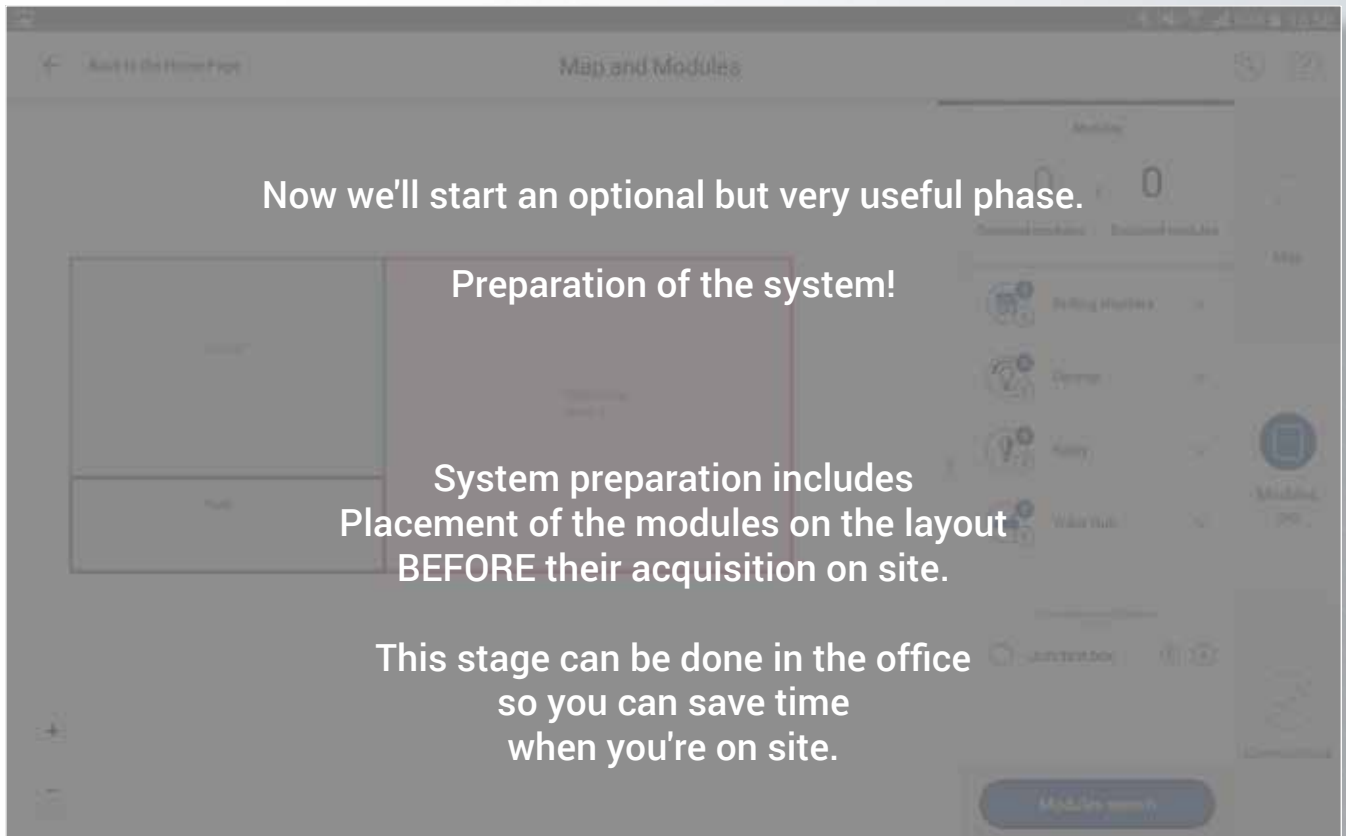

Before you start, here is a description of the available tools:

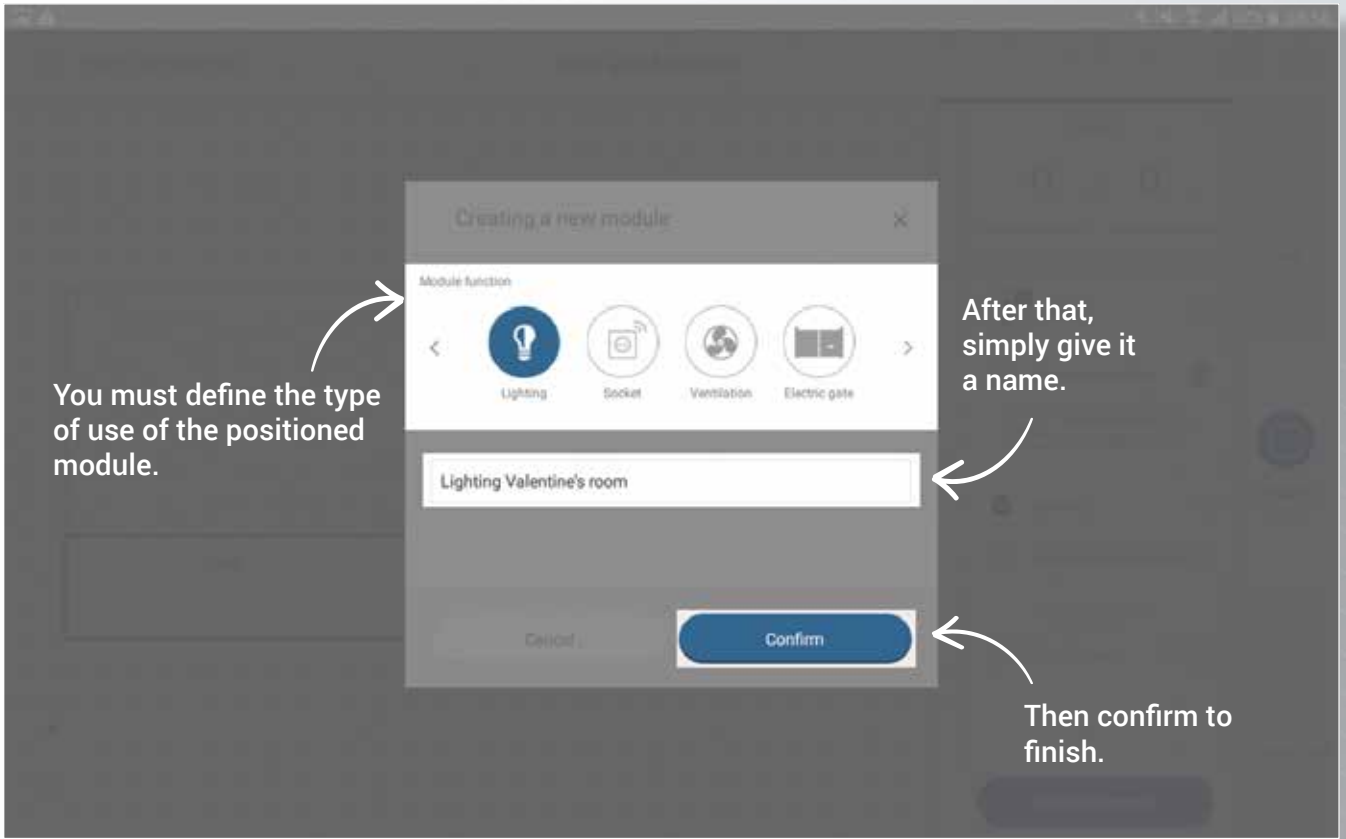

The system's radio modules

Place the modules on the layout / Preparation on site

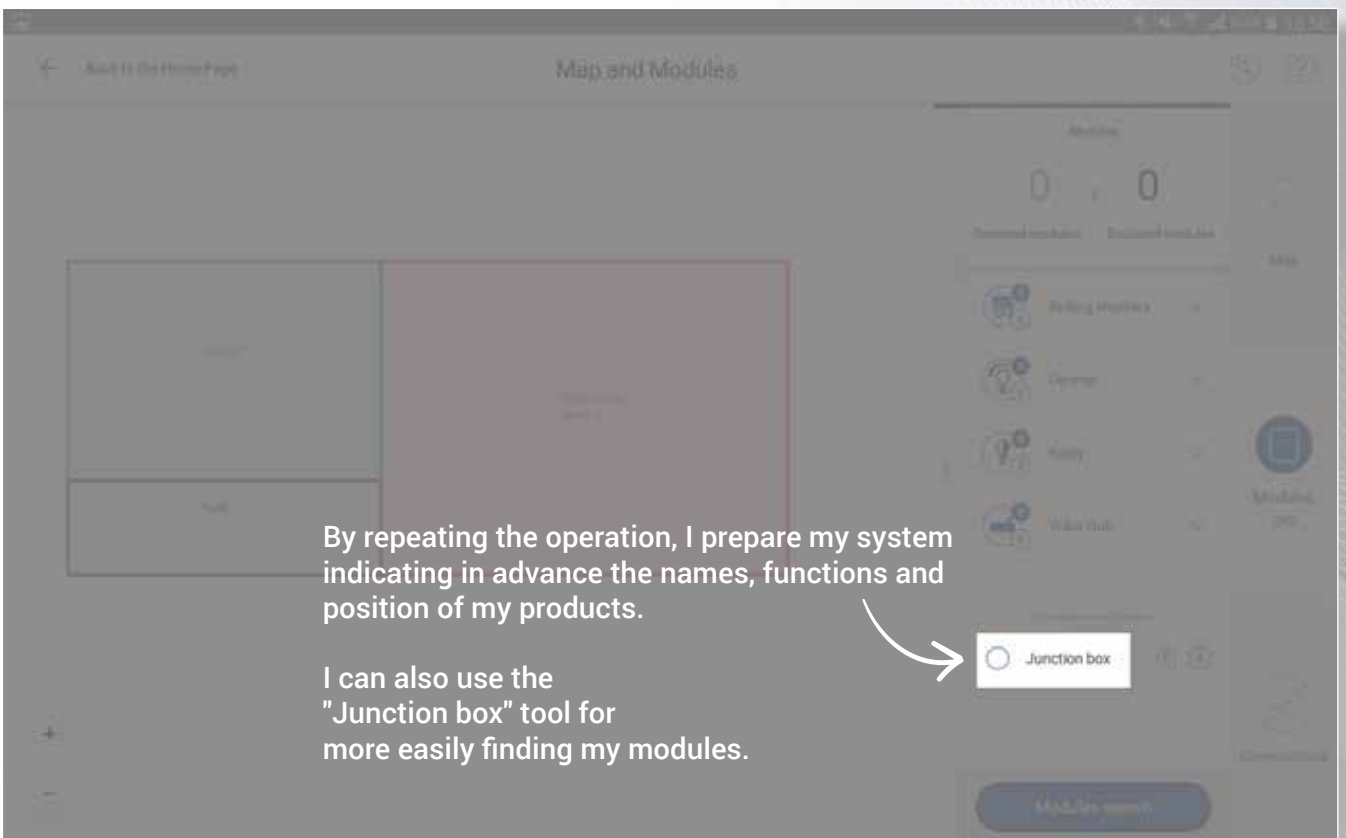

As with the rooms, this phase is very important because the correct functioning of scenarios depends on it.

You must define the type of use of the positioned module.

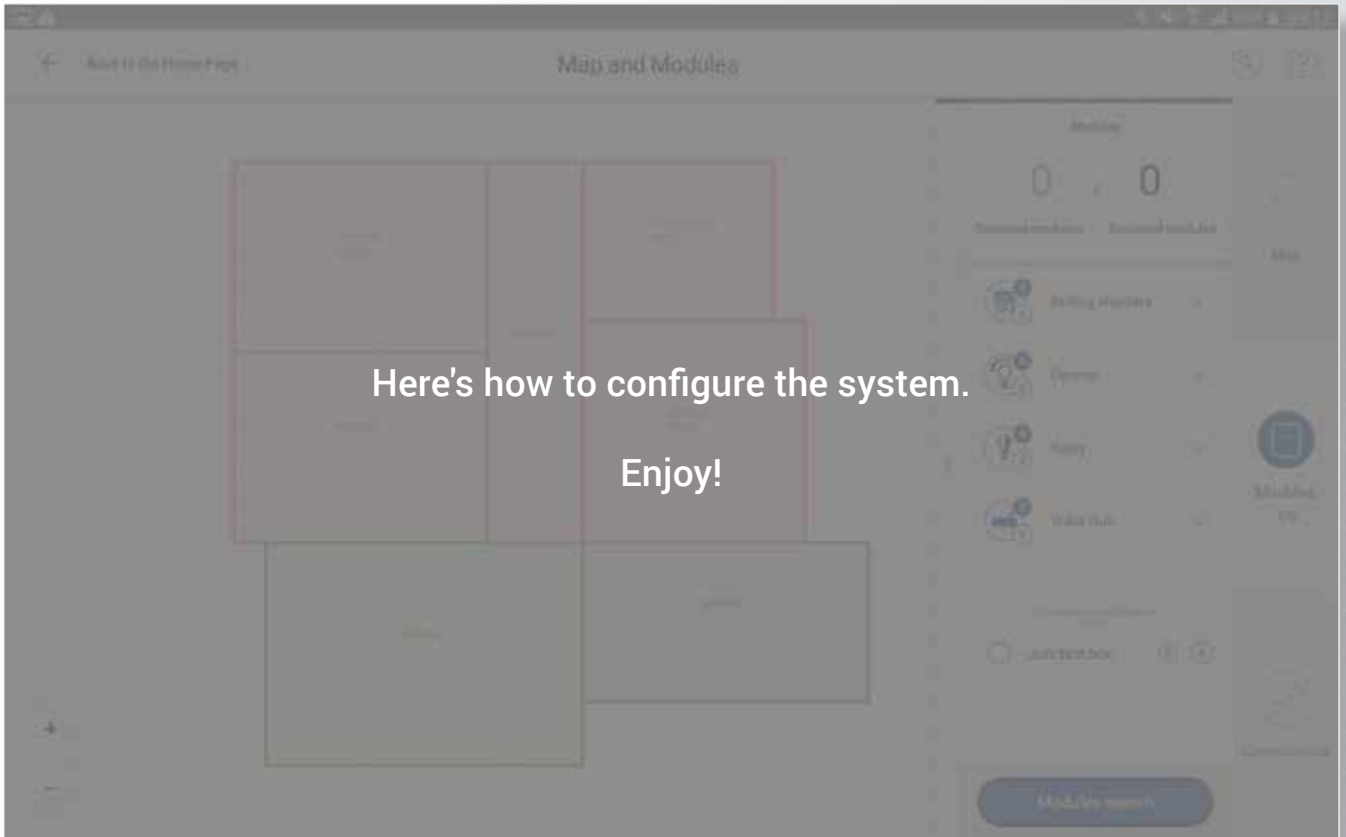

After that, simply give it a name.

Then confirm to finish.

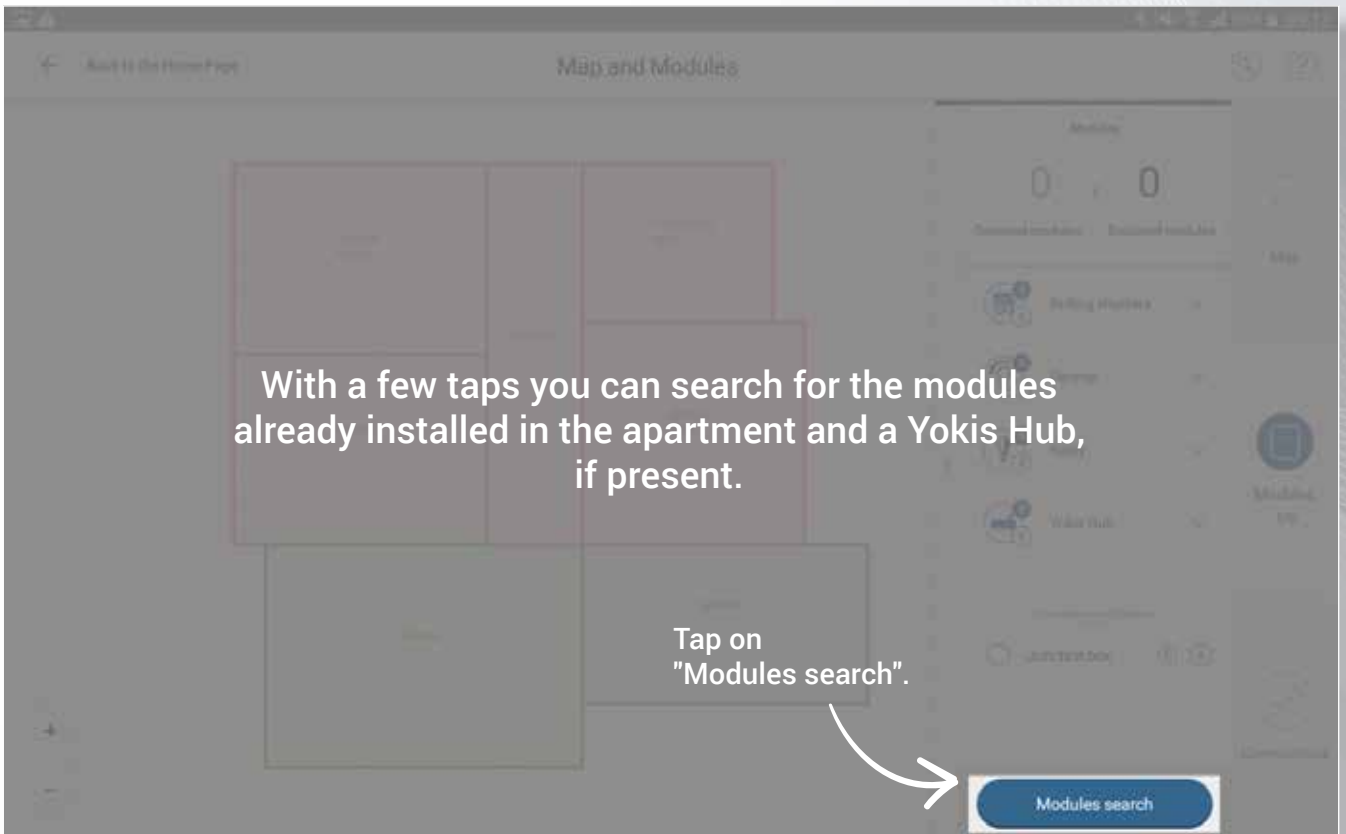

By repeating the operation, I prepare my system indicating in advance the names, functions and position of my products.

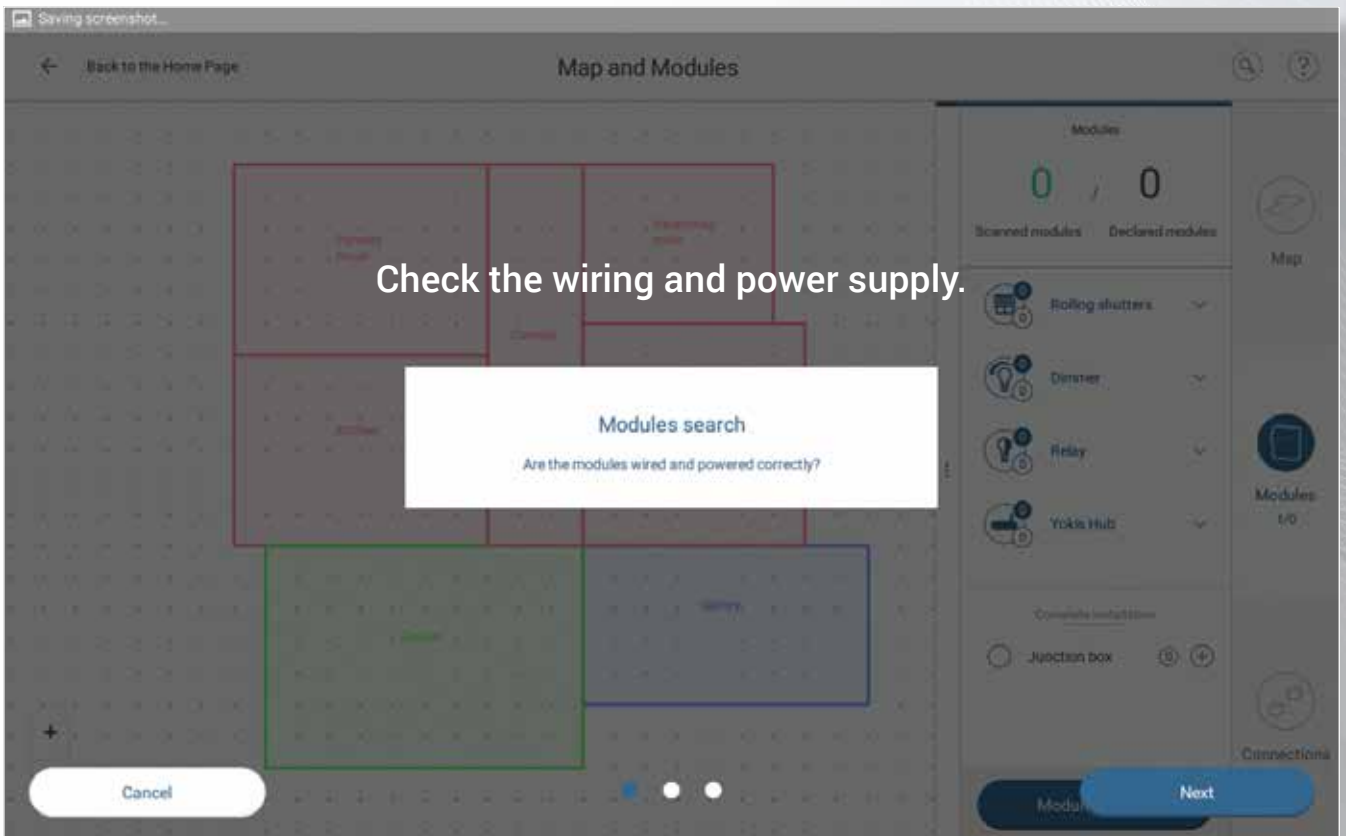

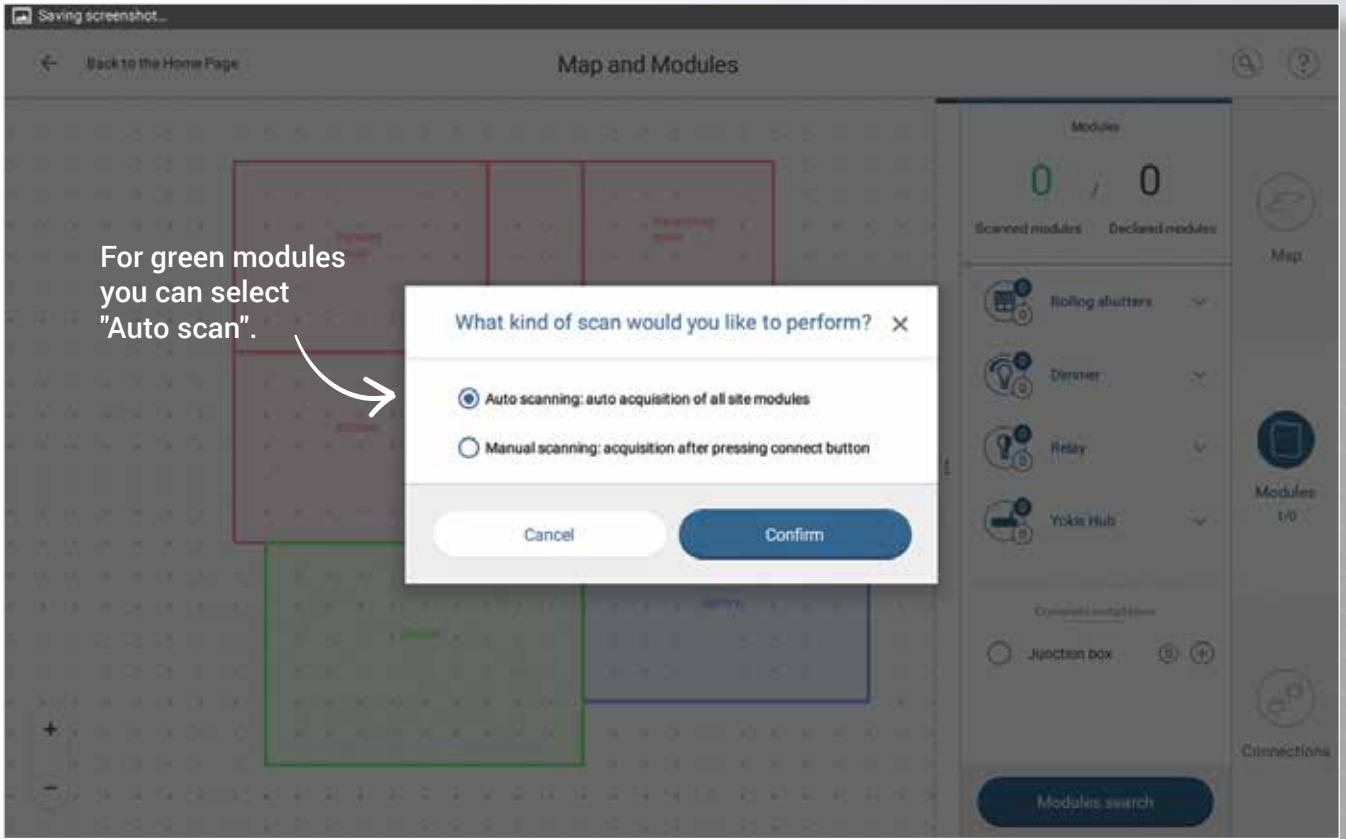

I can also use the "Junction box" tool for more easily finding my modules.

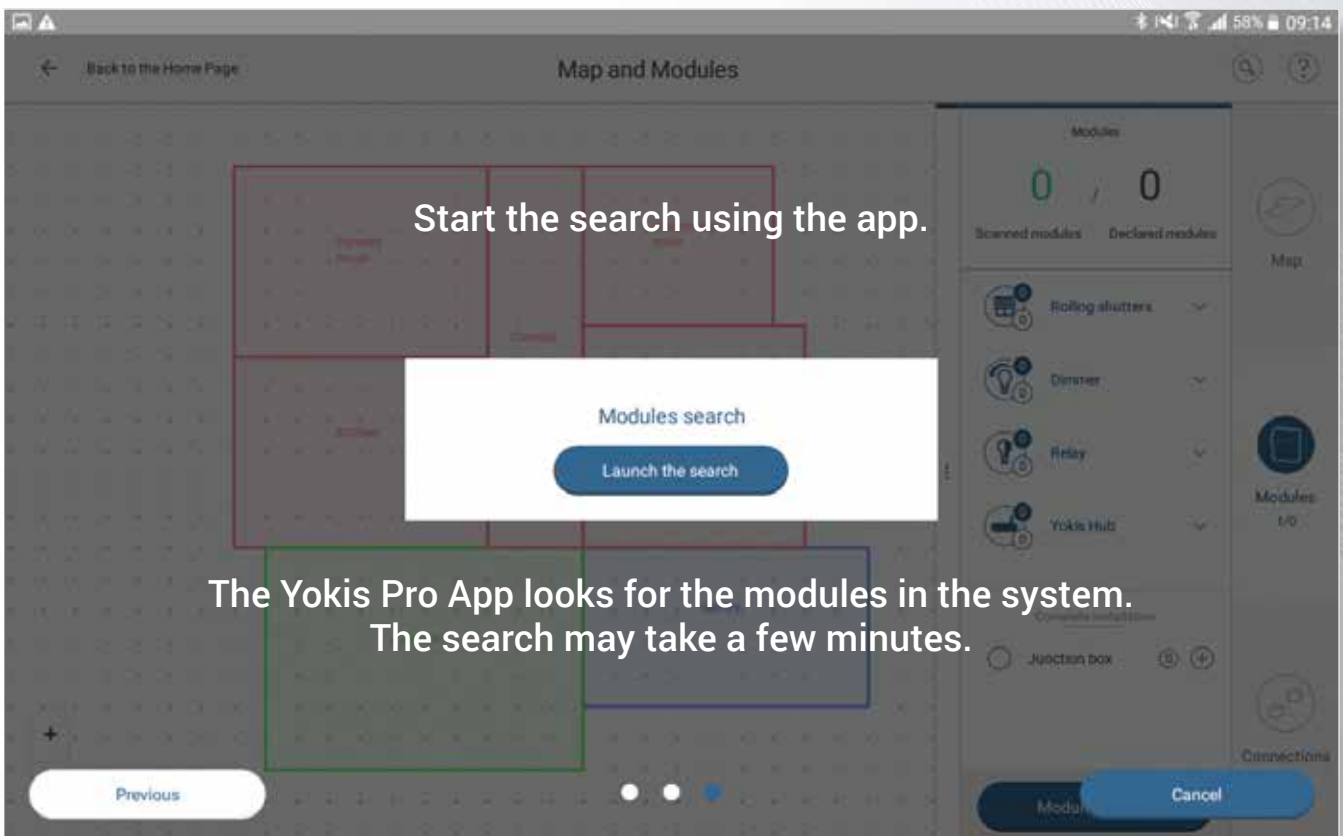

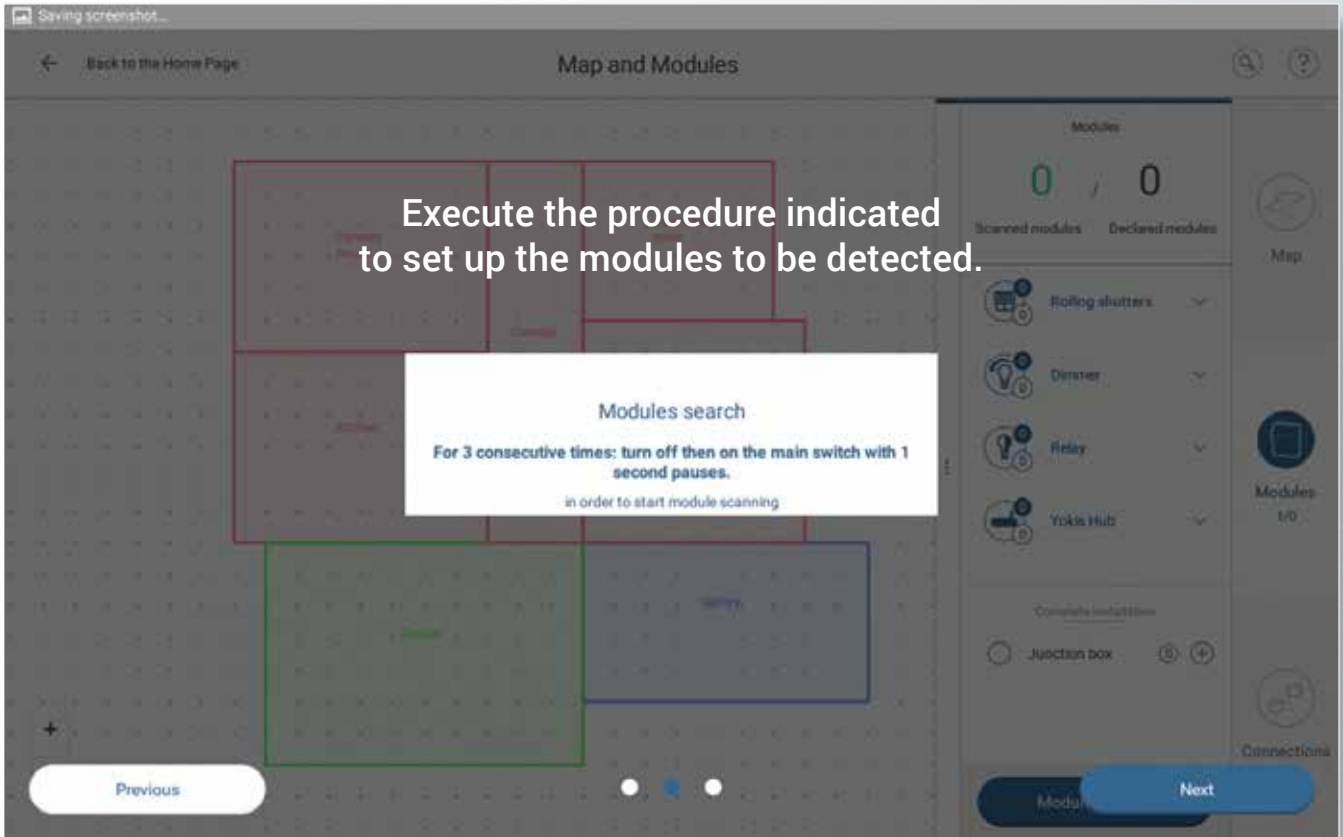

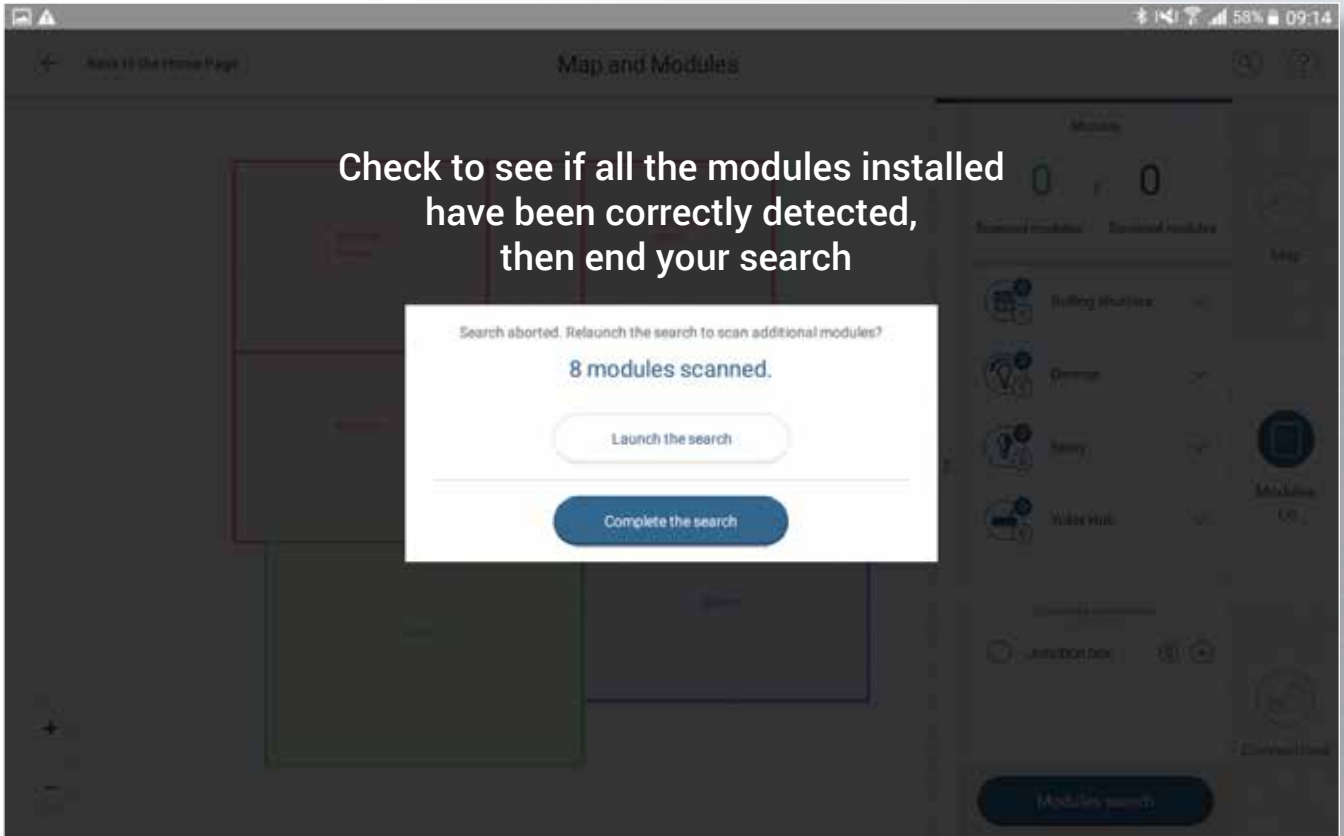

Acquisition of YOKIS radio modules

How to acquire the modules / the Yokis Hub automatically

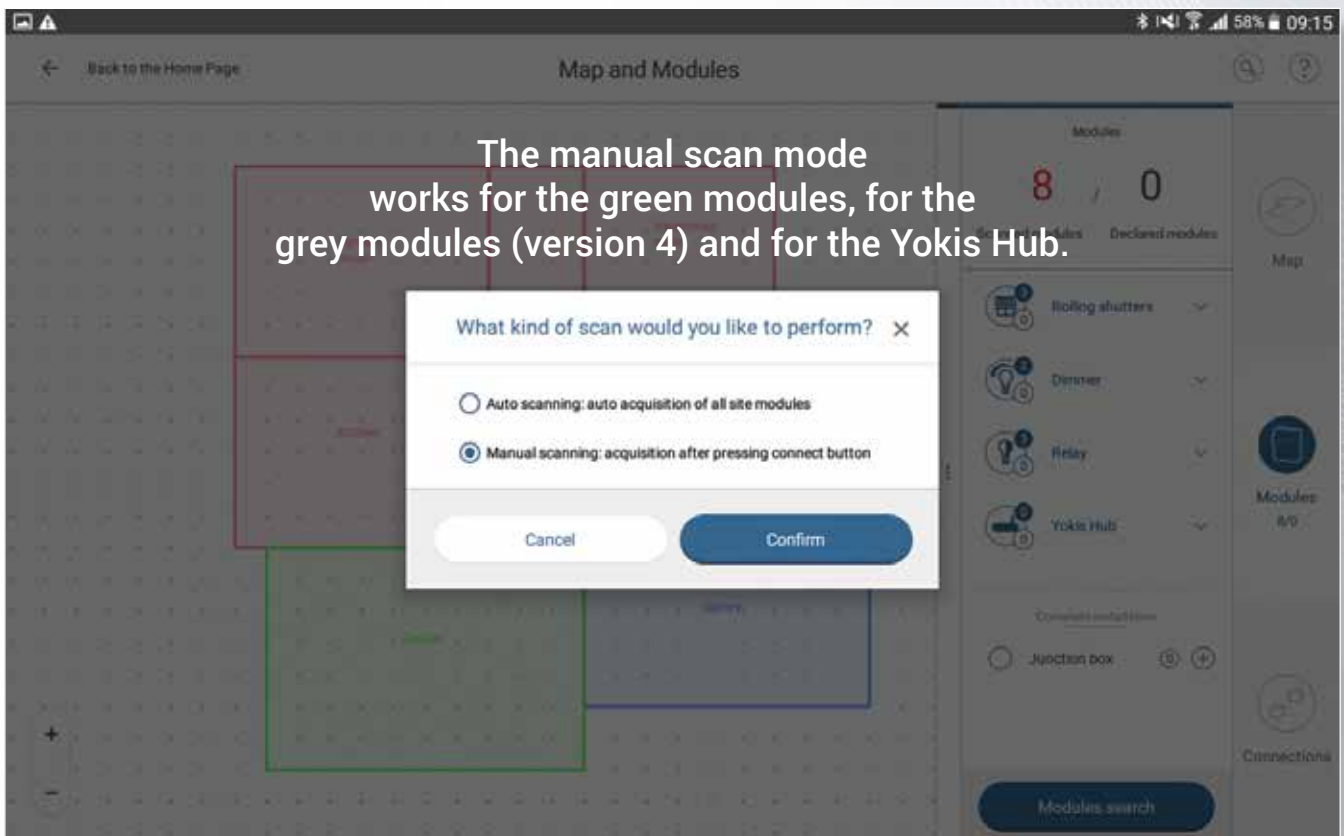

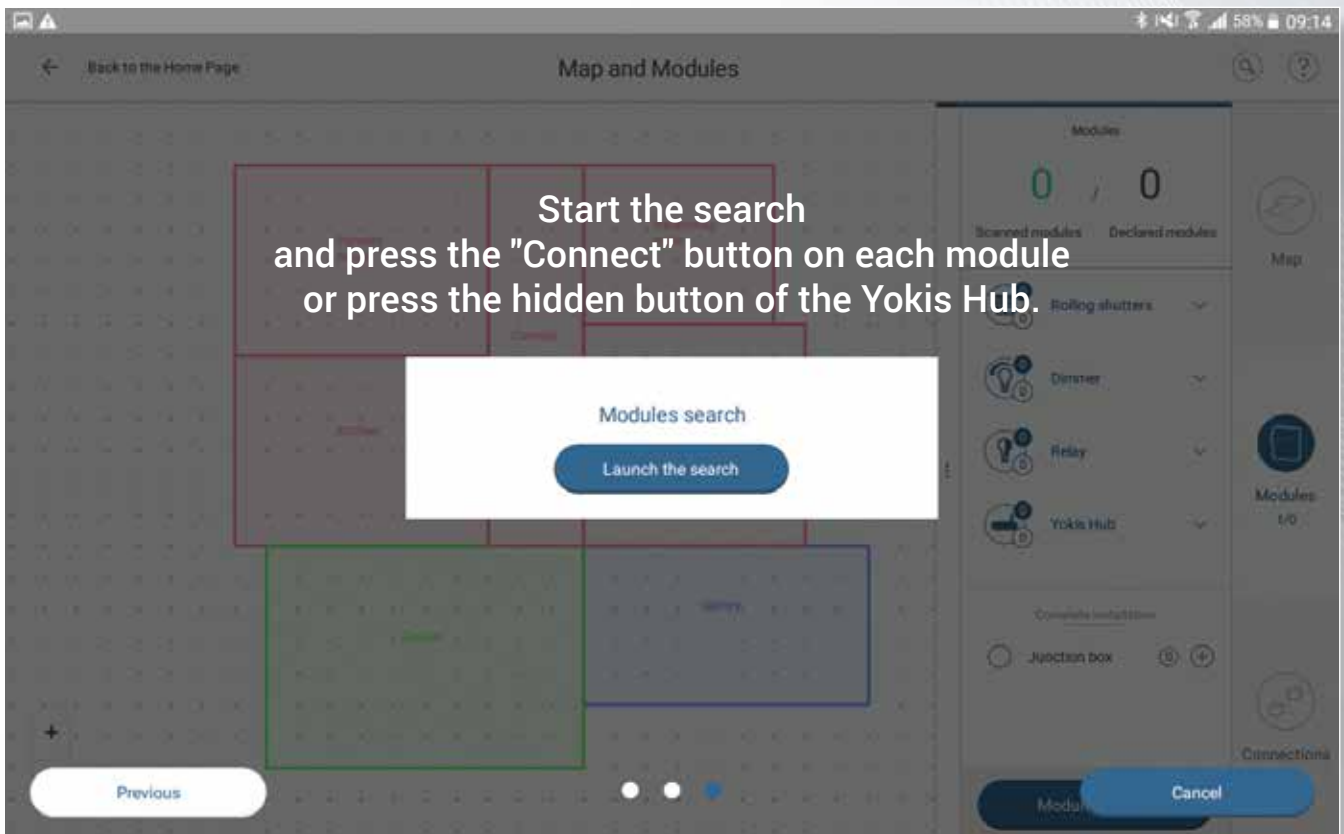

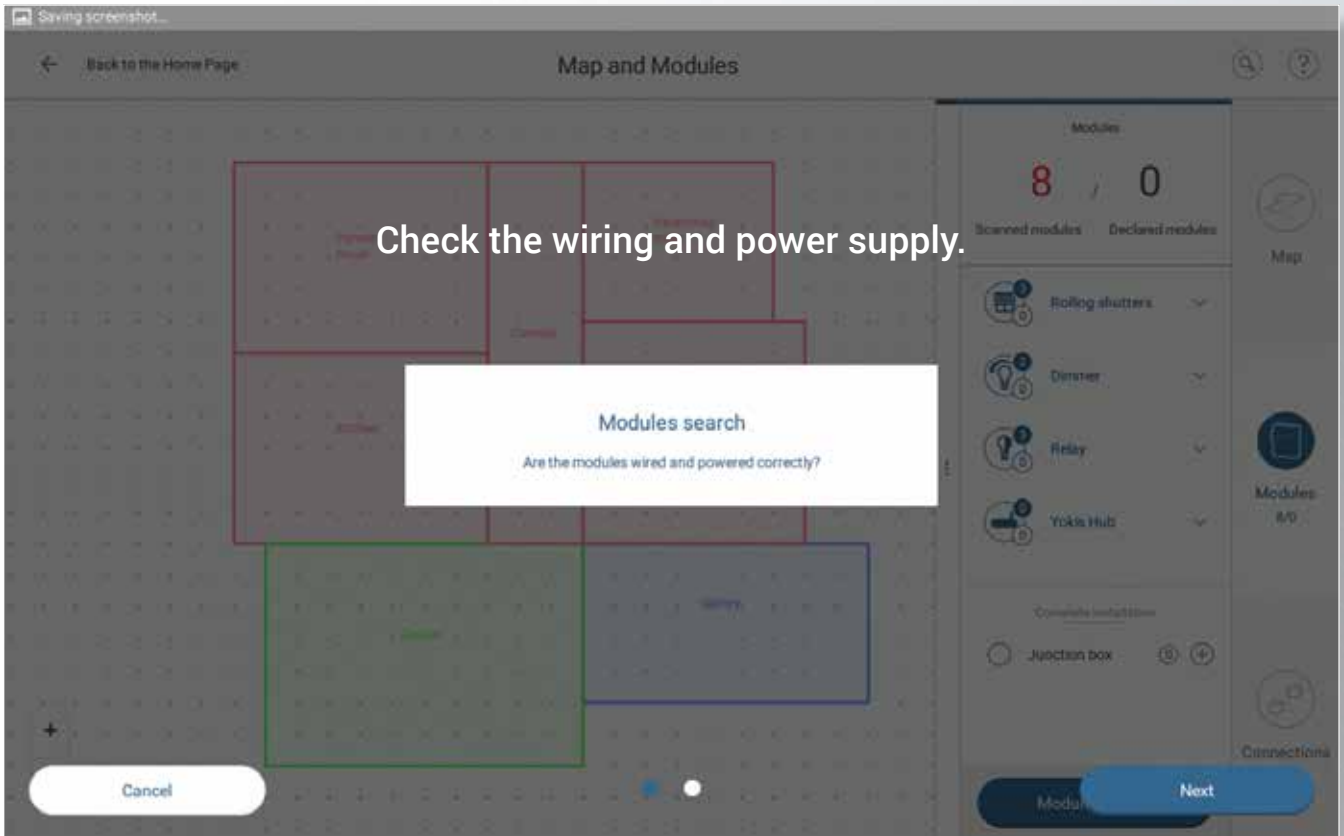

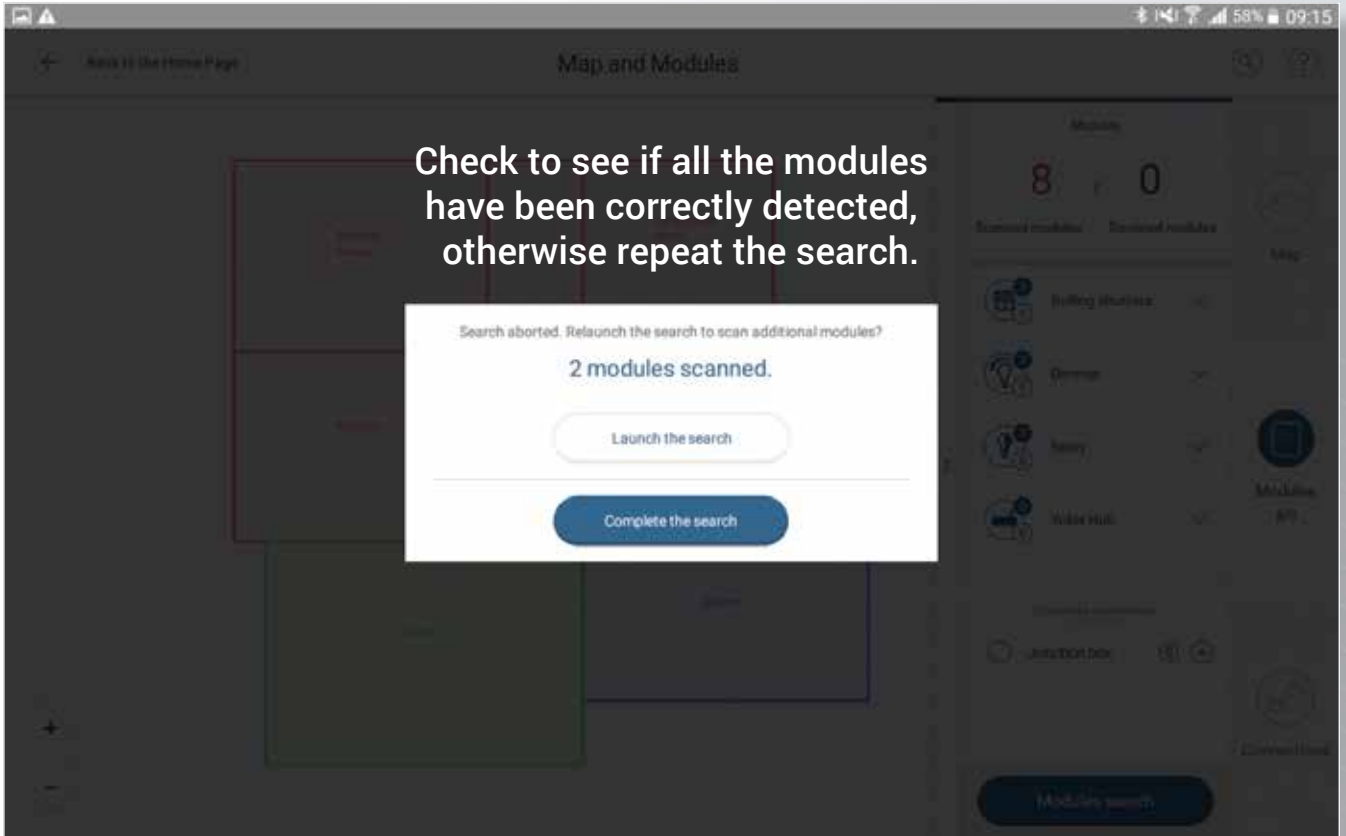

Acquisition of YOKIS radio modules

How to acquire the modules / the Yokis Hub manually

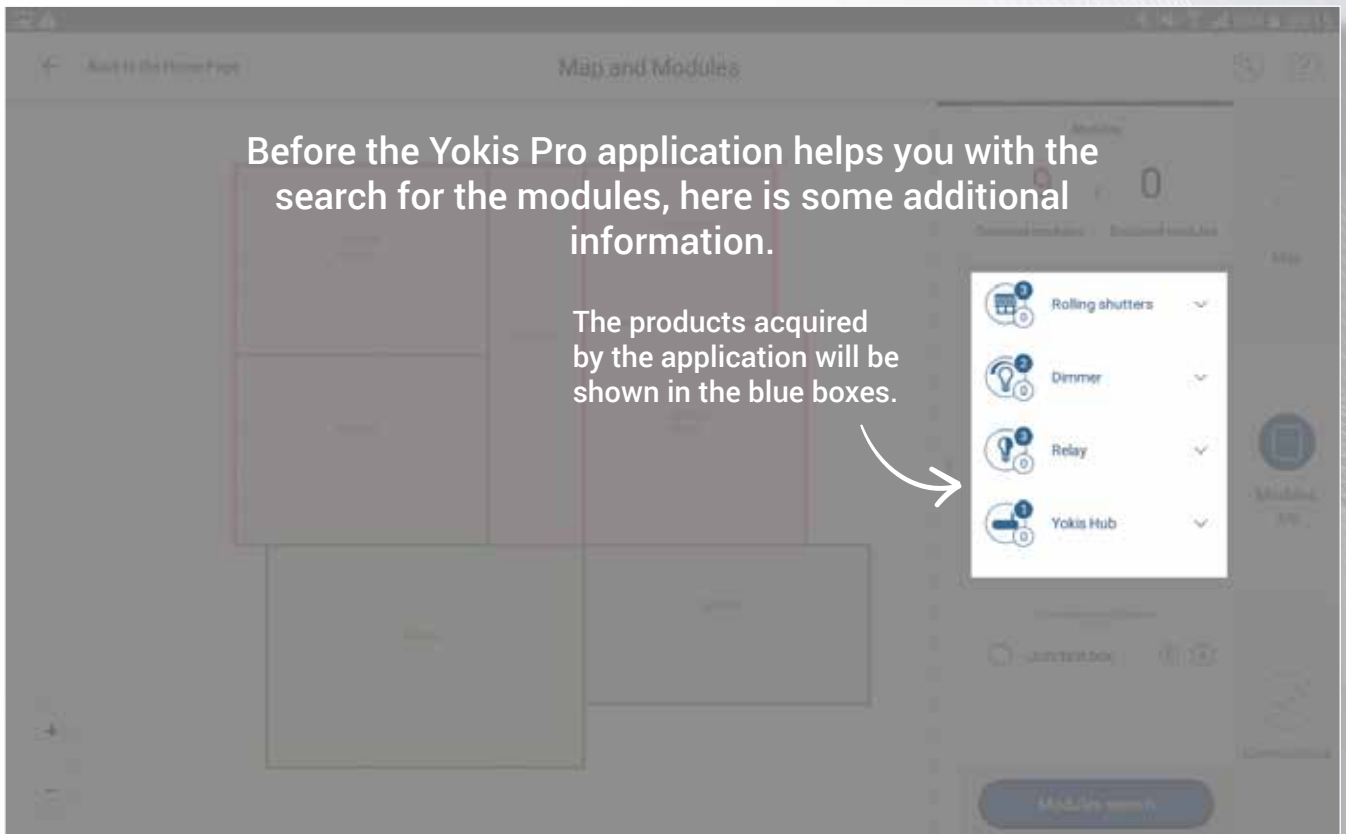

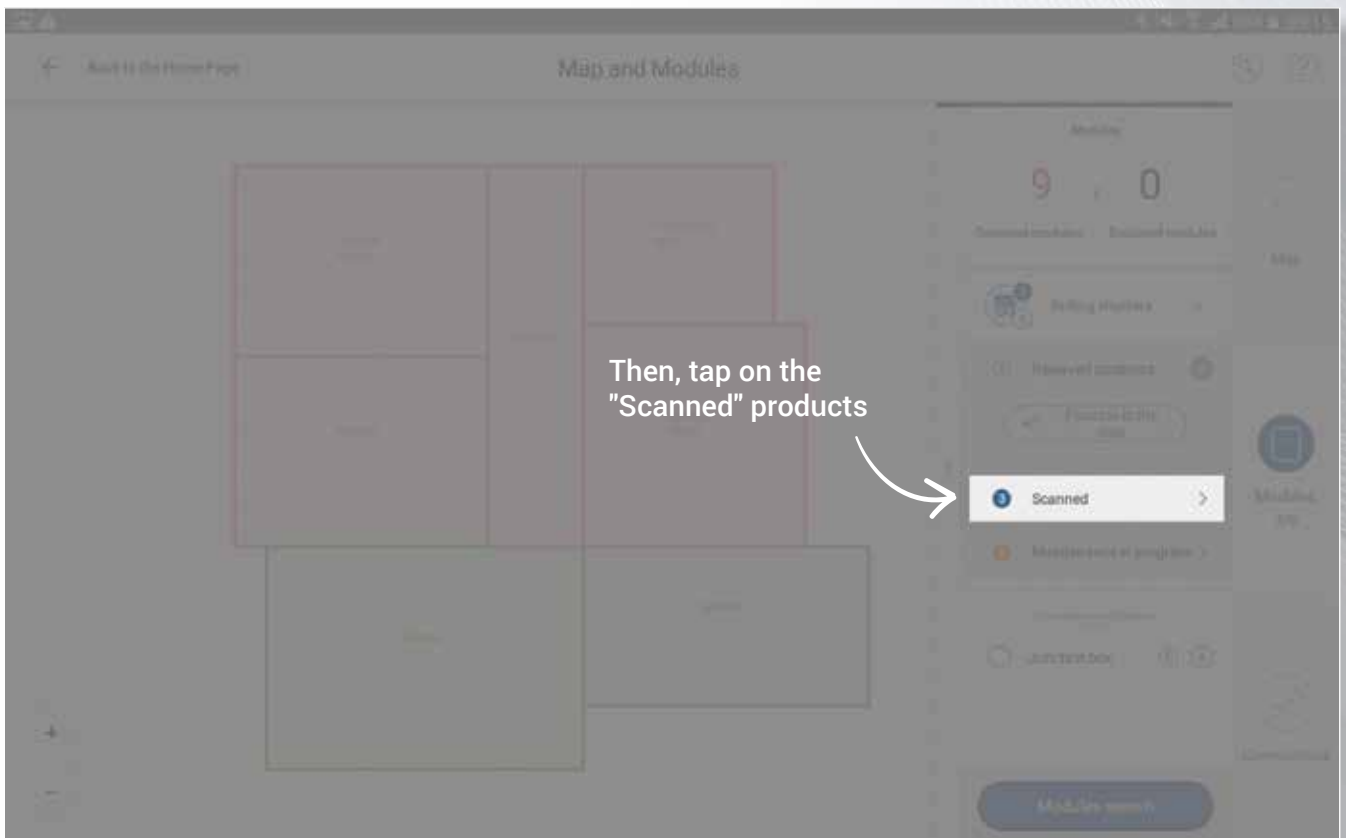

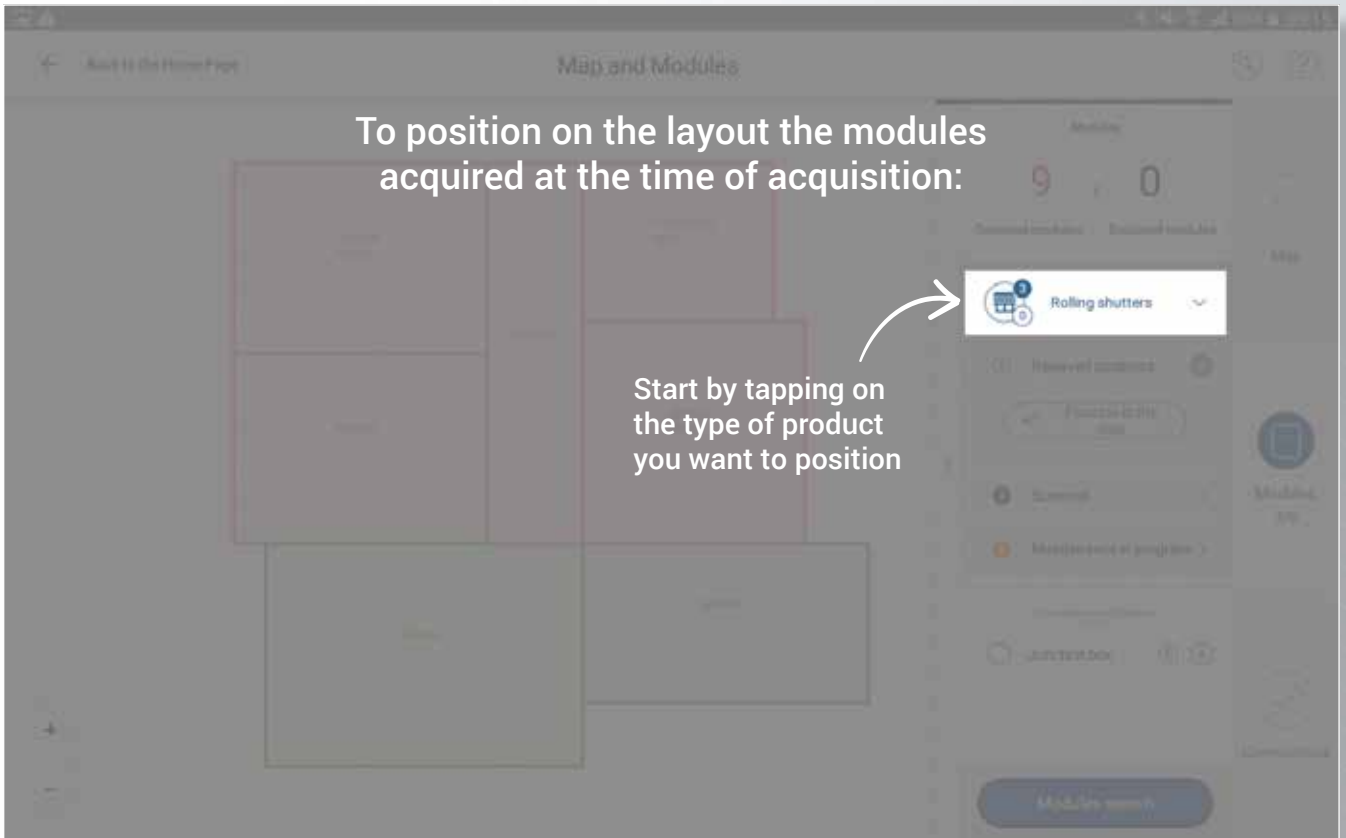

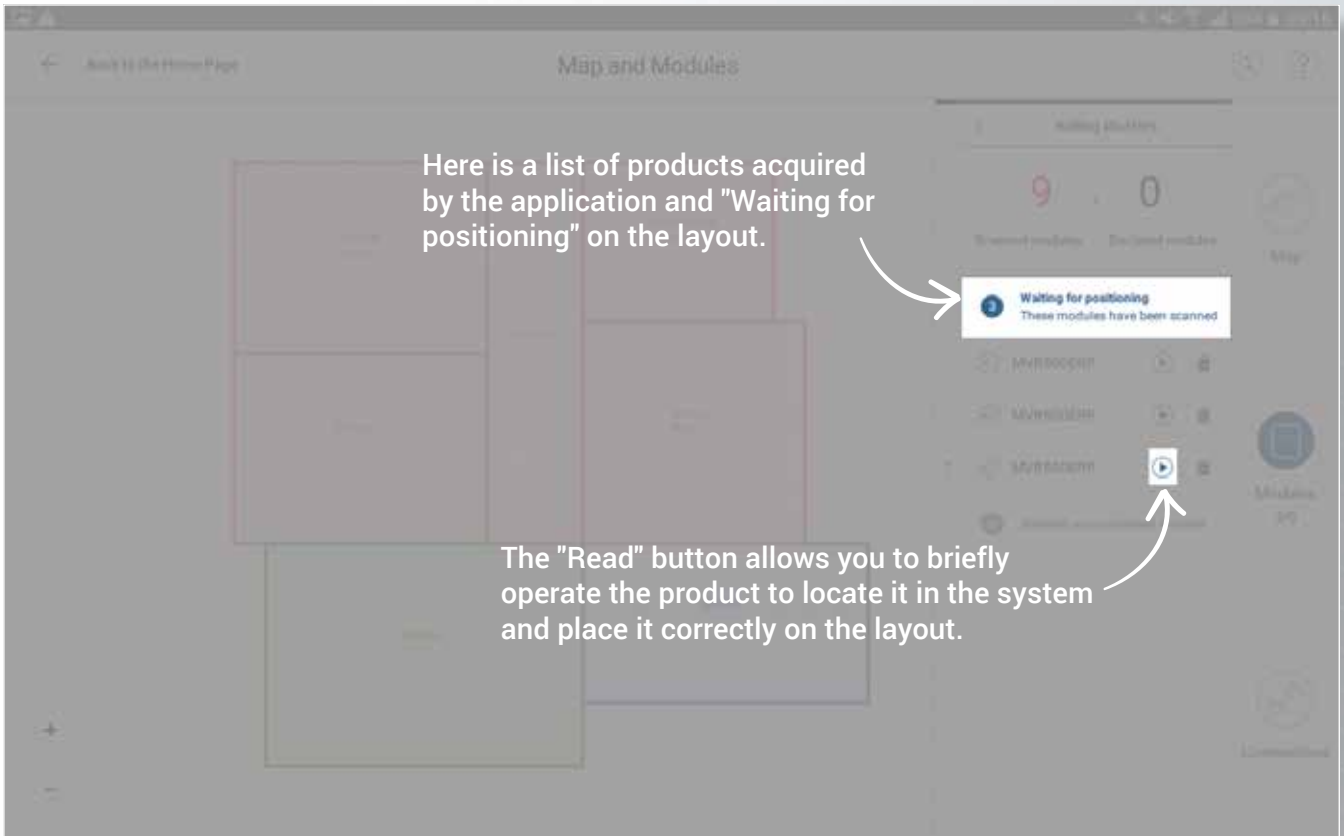

Acquisition of YOKIS radio modules

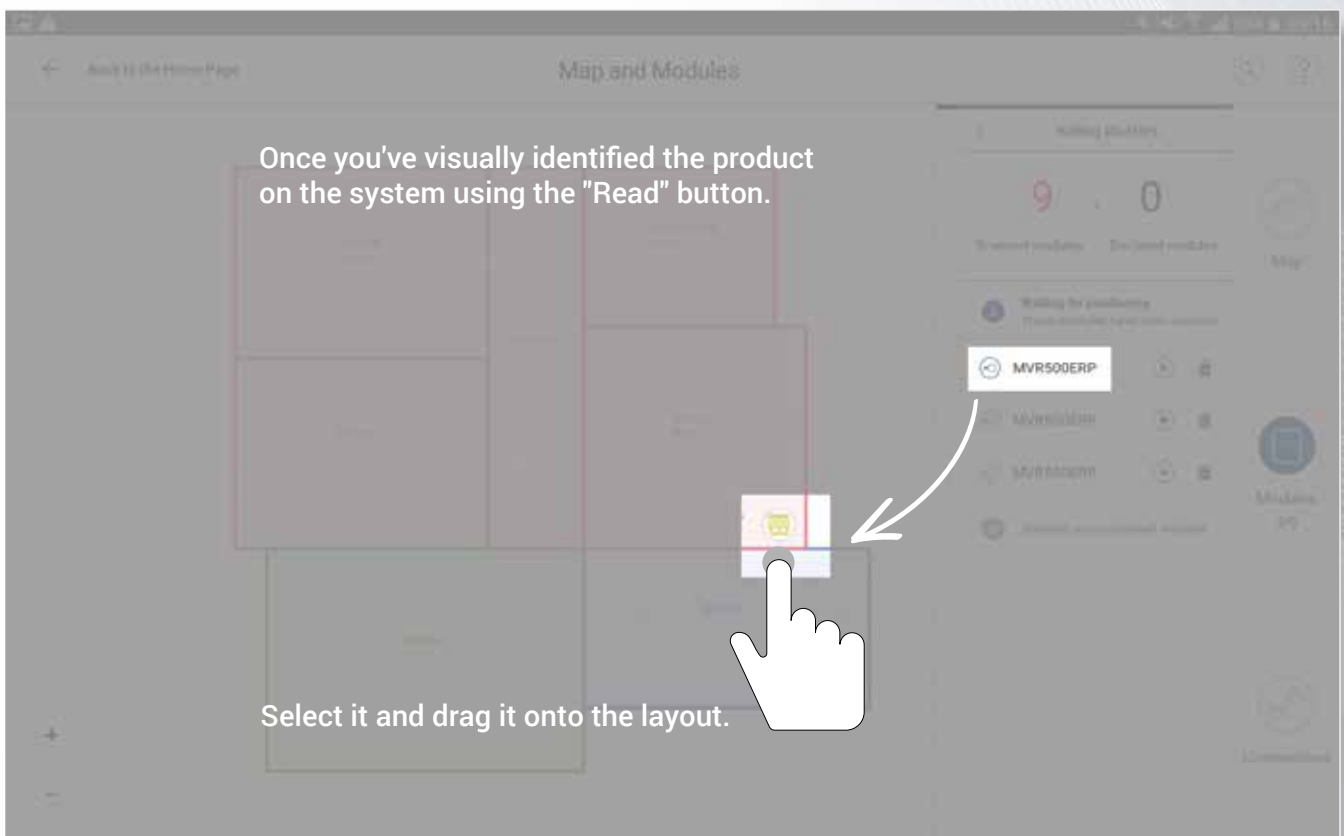

Place the acquired modules on the layout

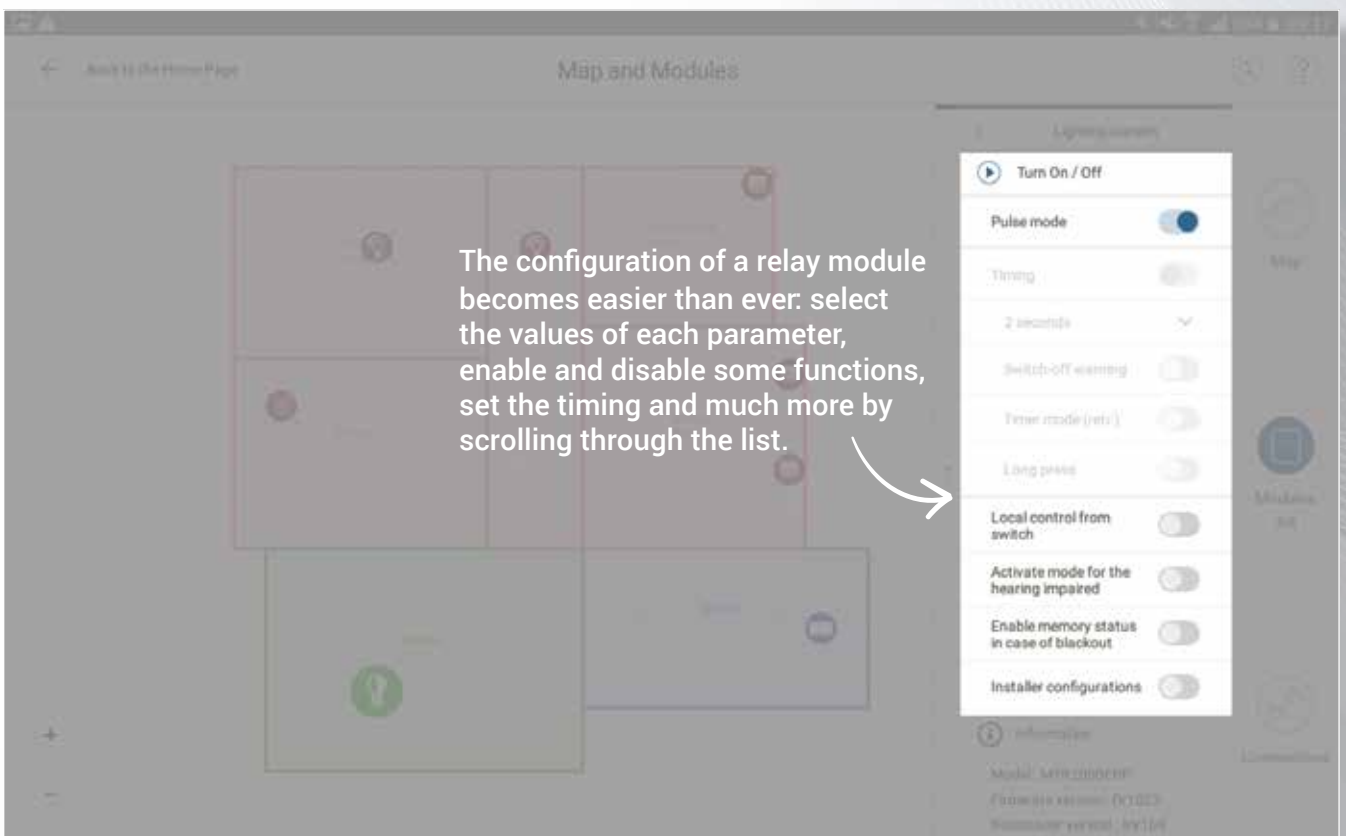

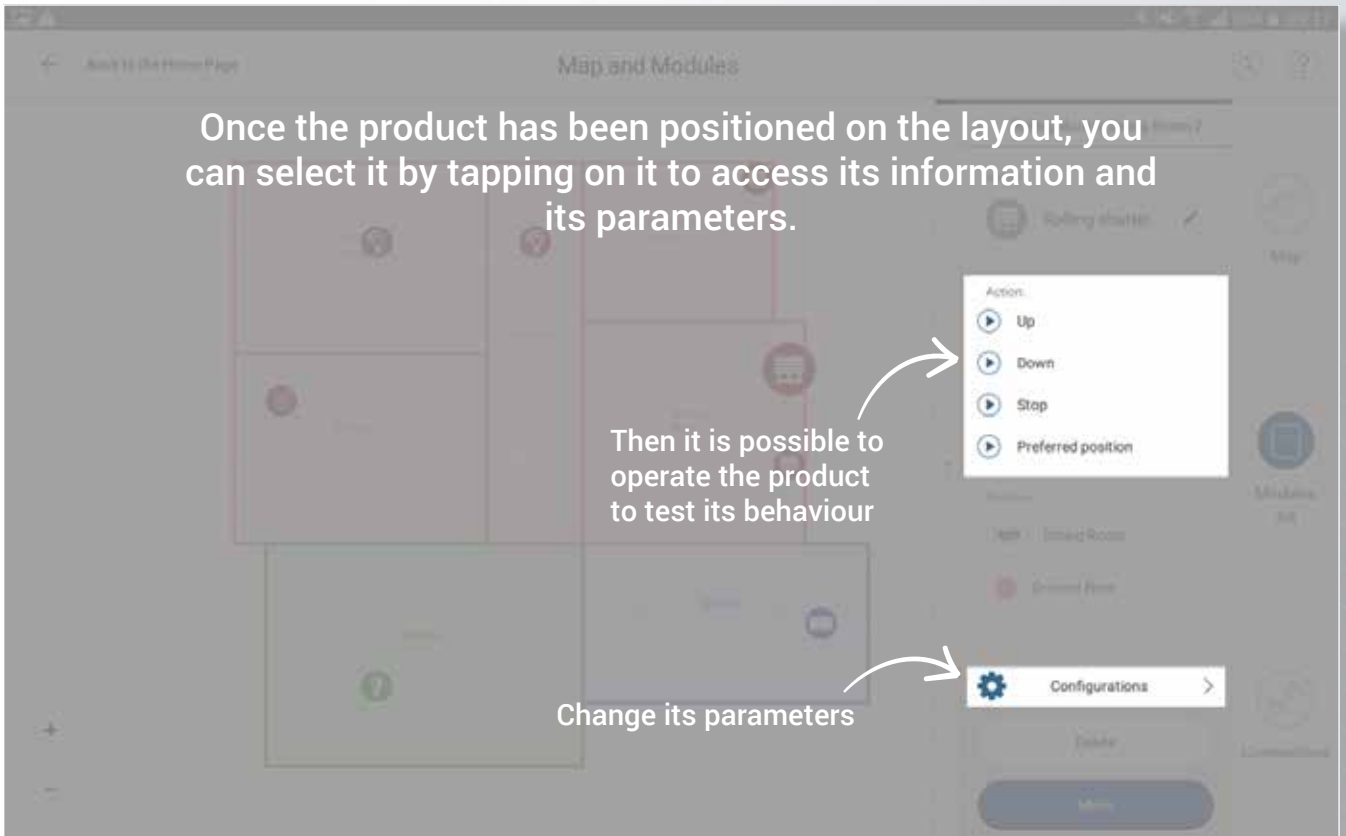

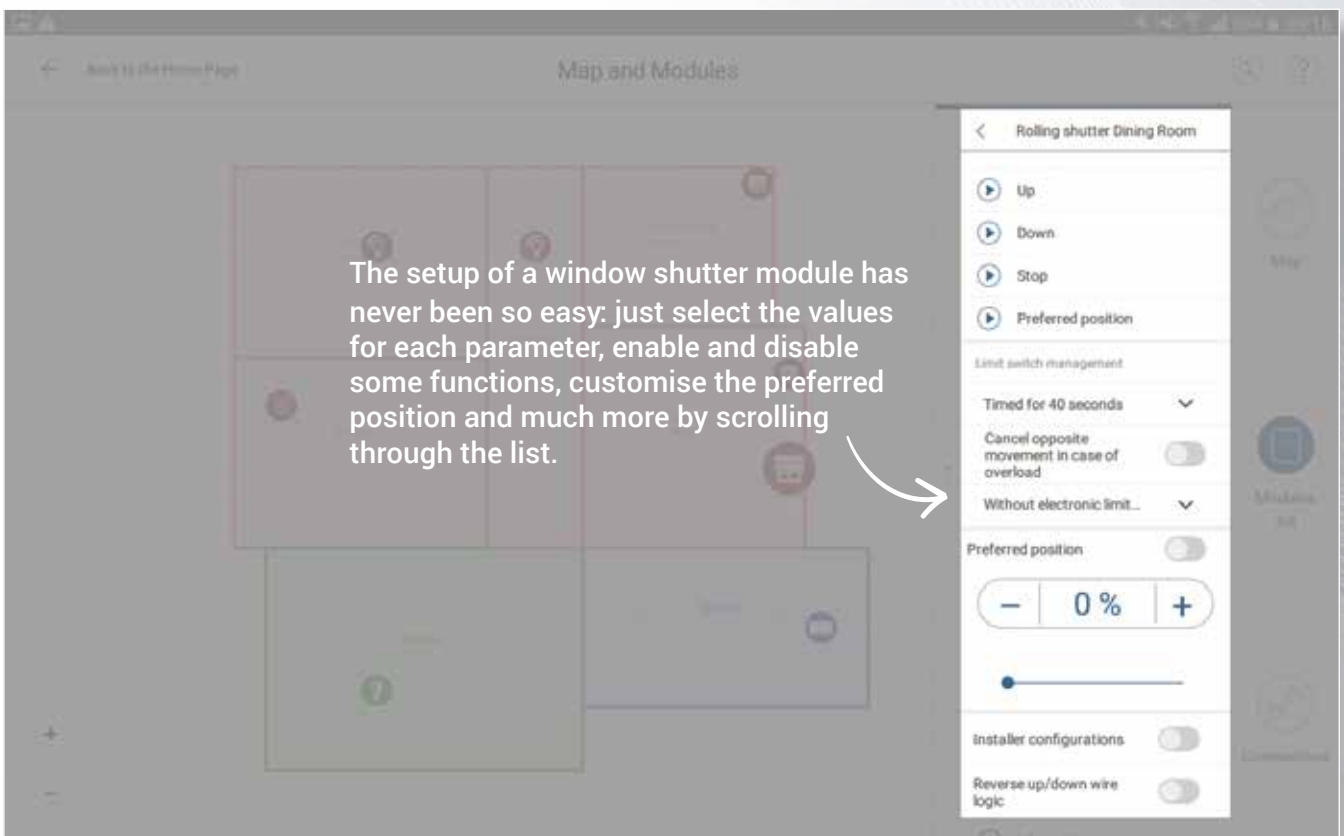

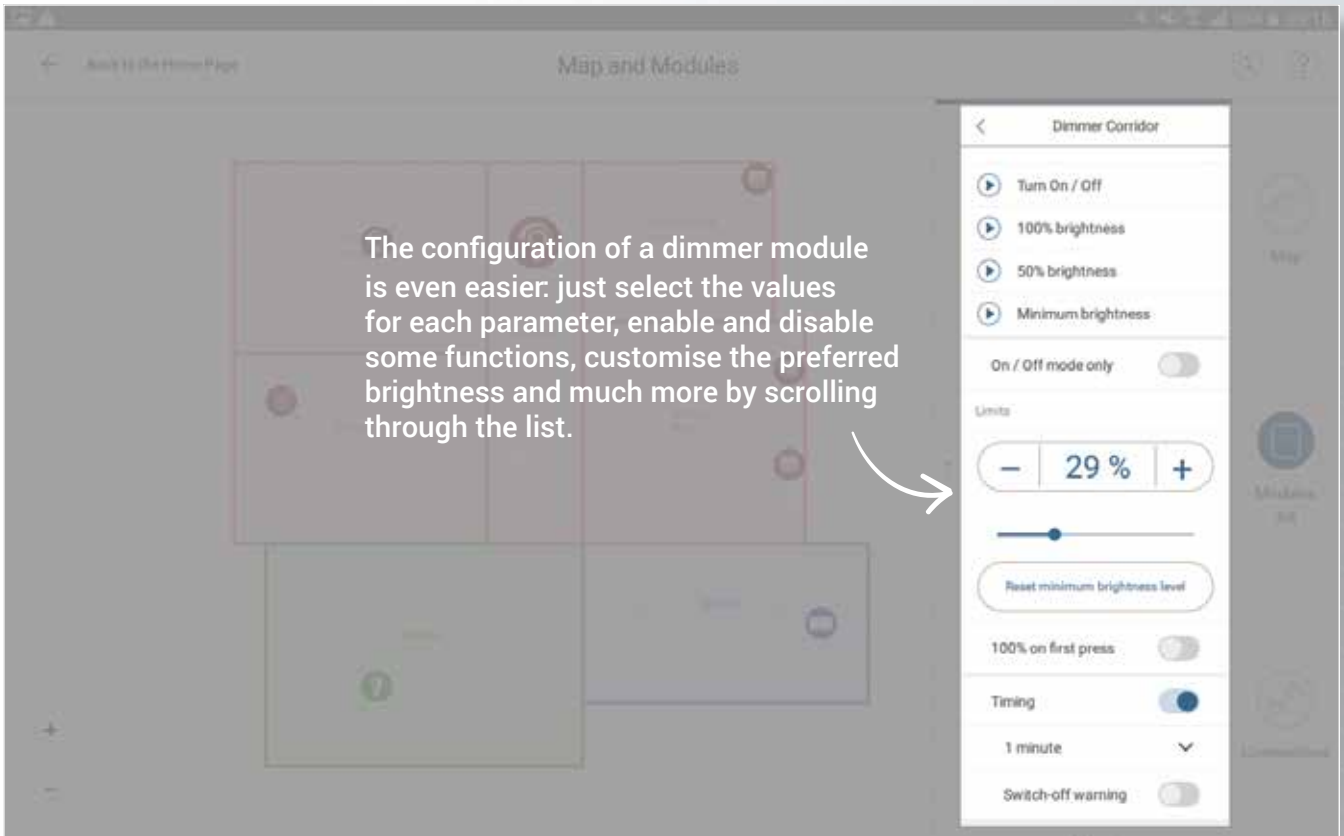

NOTE: When you press the "Read" button, the module may take a few seconds to operate the connected device. Don't tap on it again!

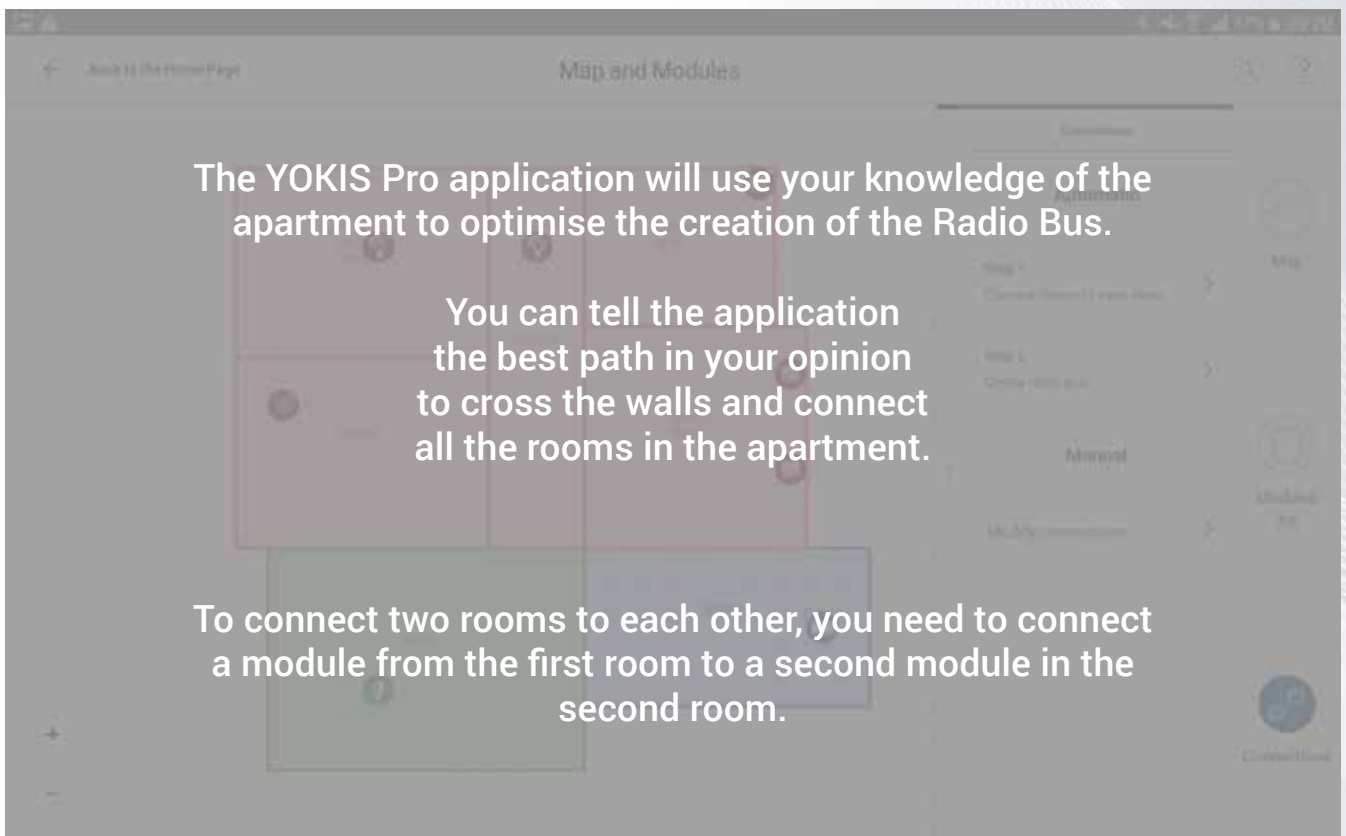

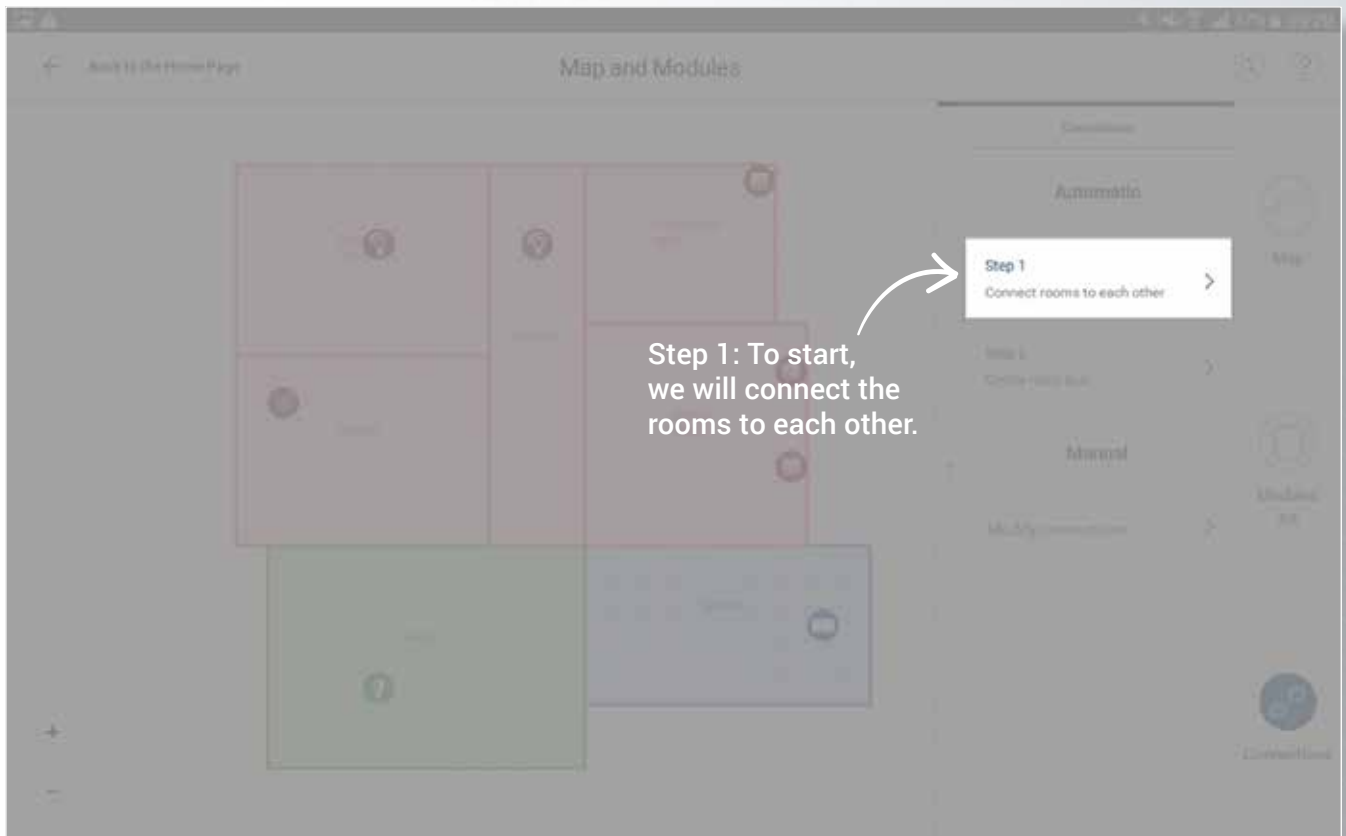

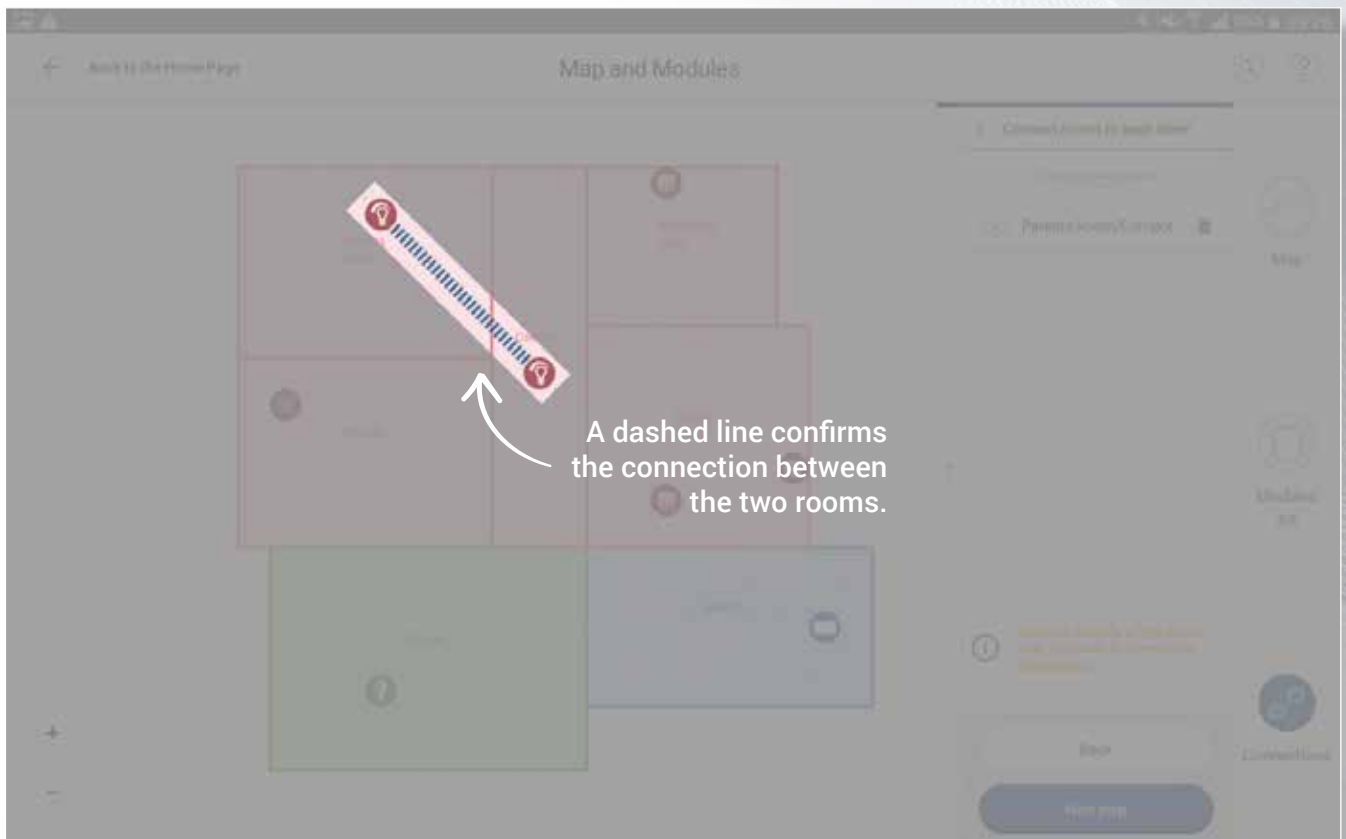

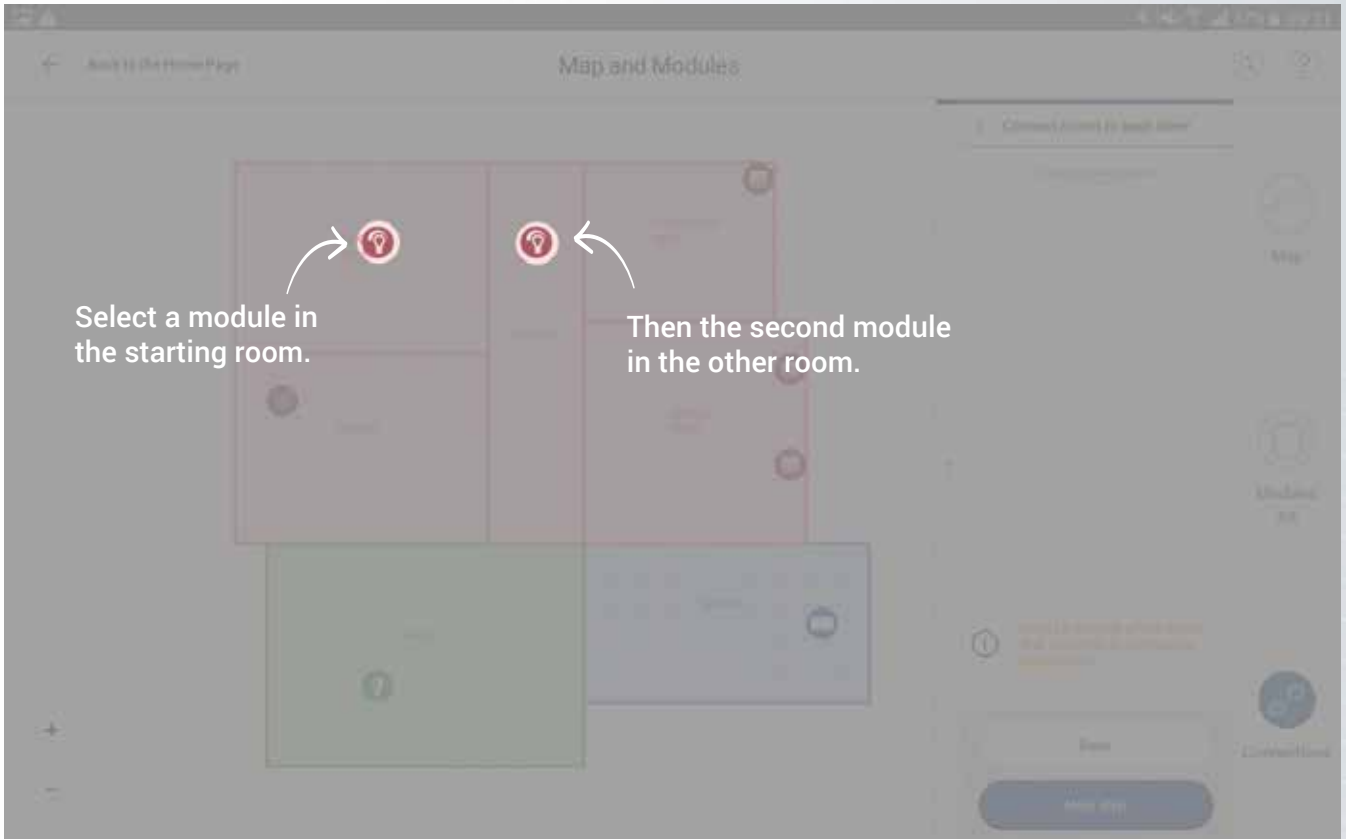

The modules have been located, positioned and configured?
 Now it's time to let them communicate by creating the Yokis Radio Bus

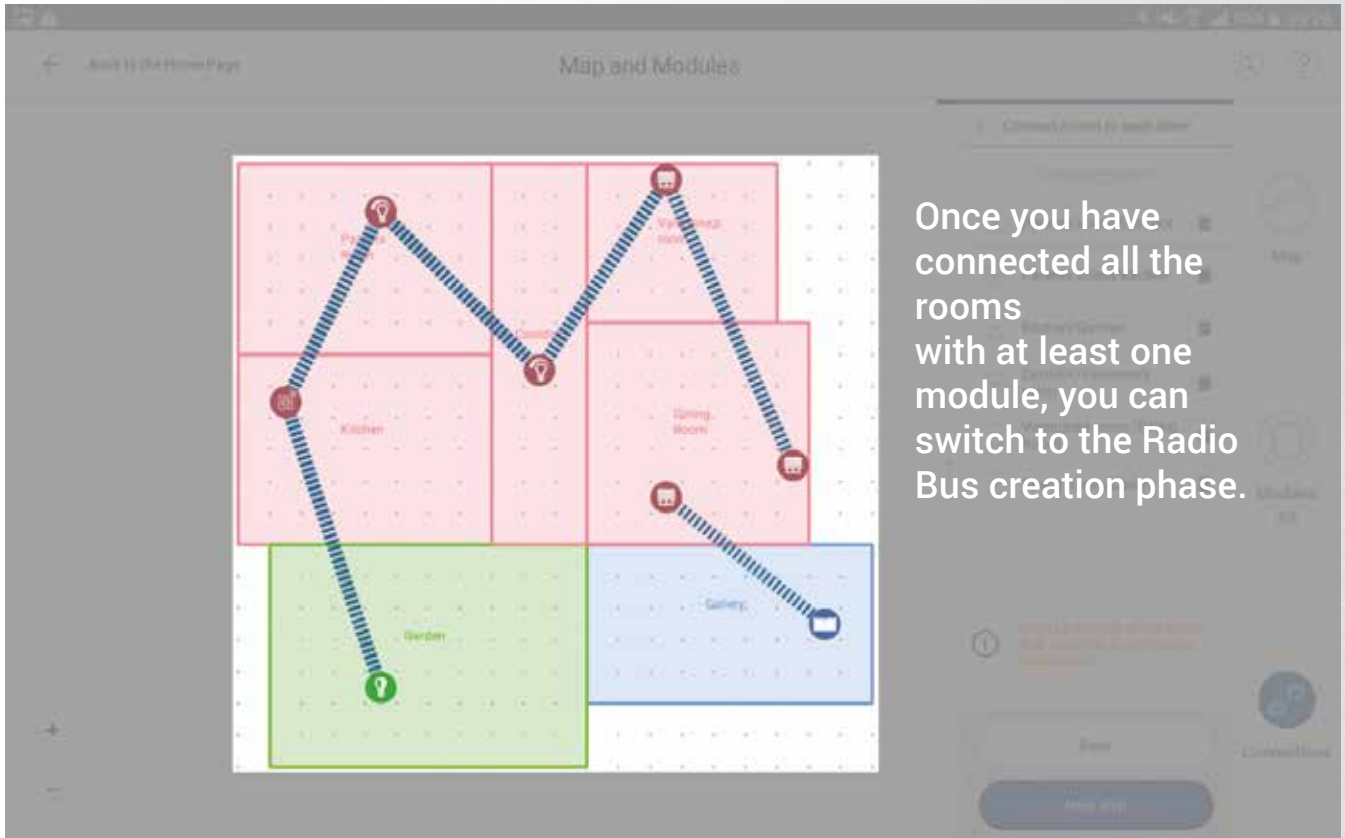

Creation of the Radio Bus

Connections between rooms

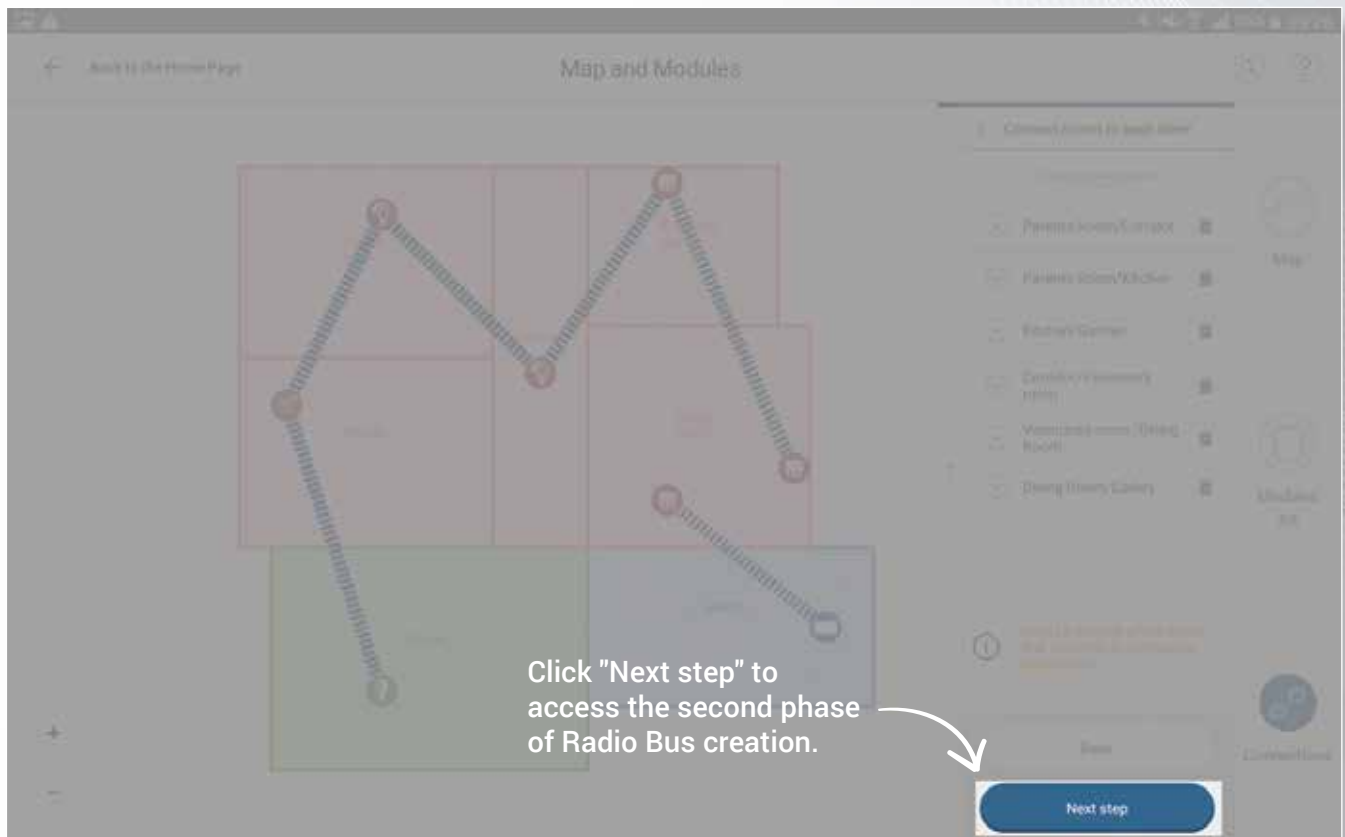

NOTE: In the event of an error, you can remove a link by re-selecting the same modules.

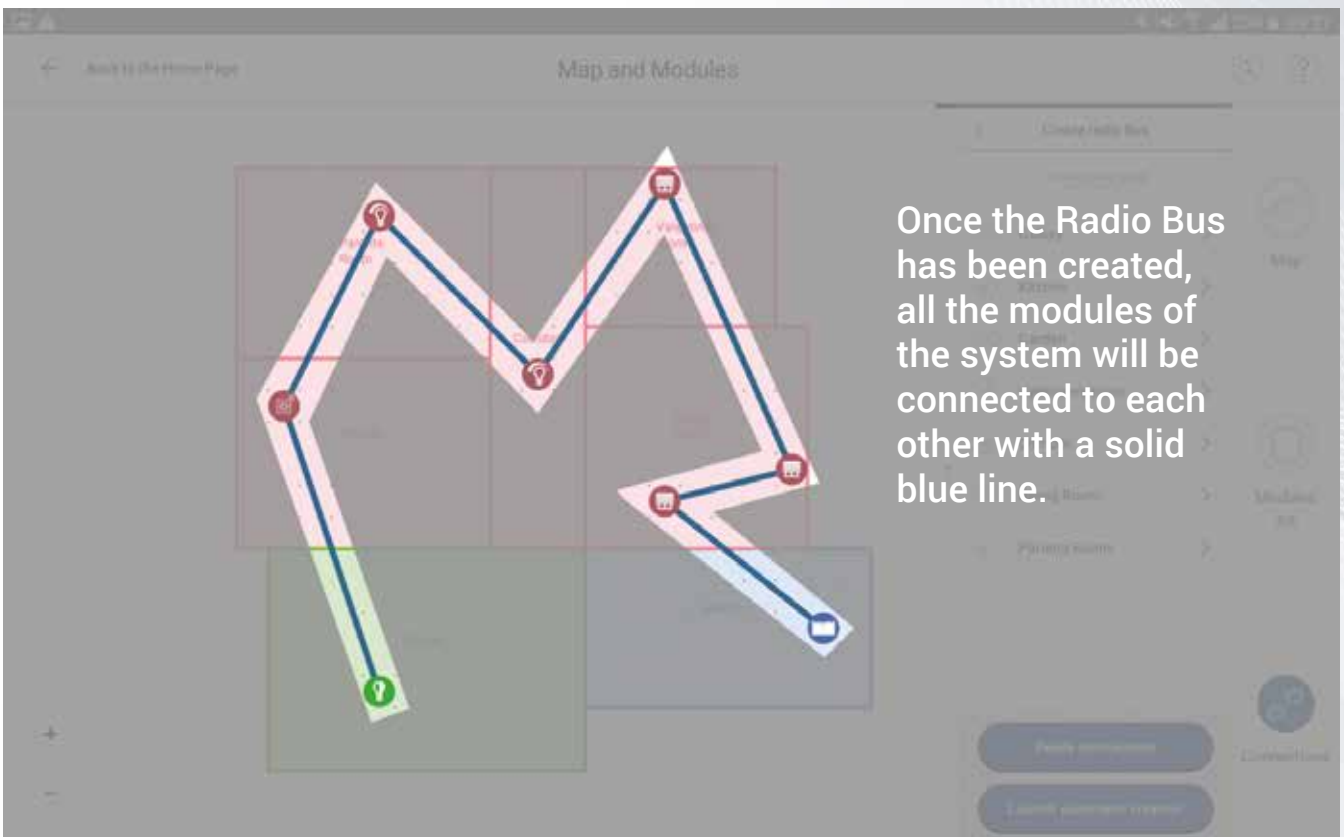

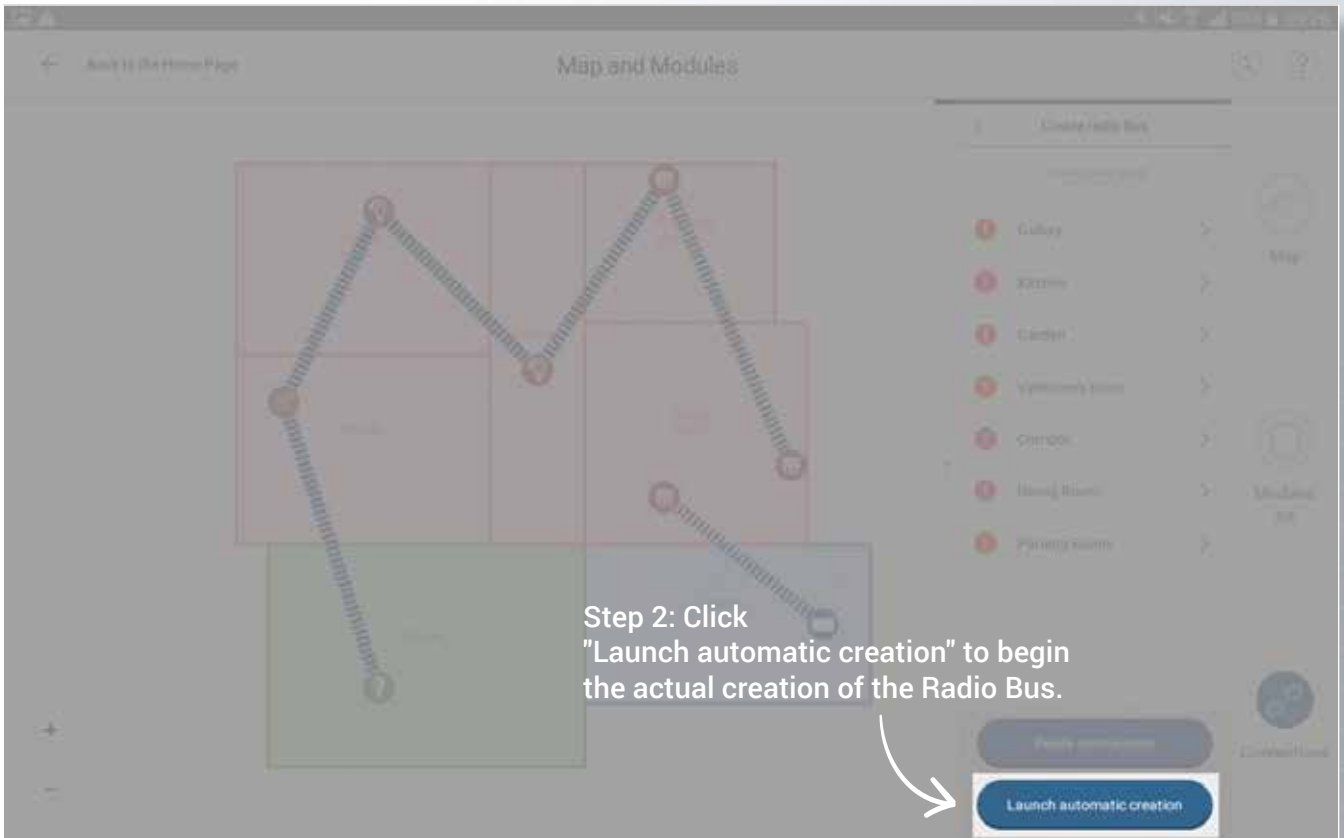

Creation of the Radio Bus

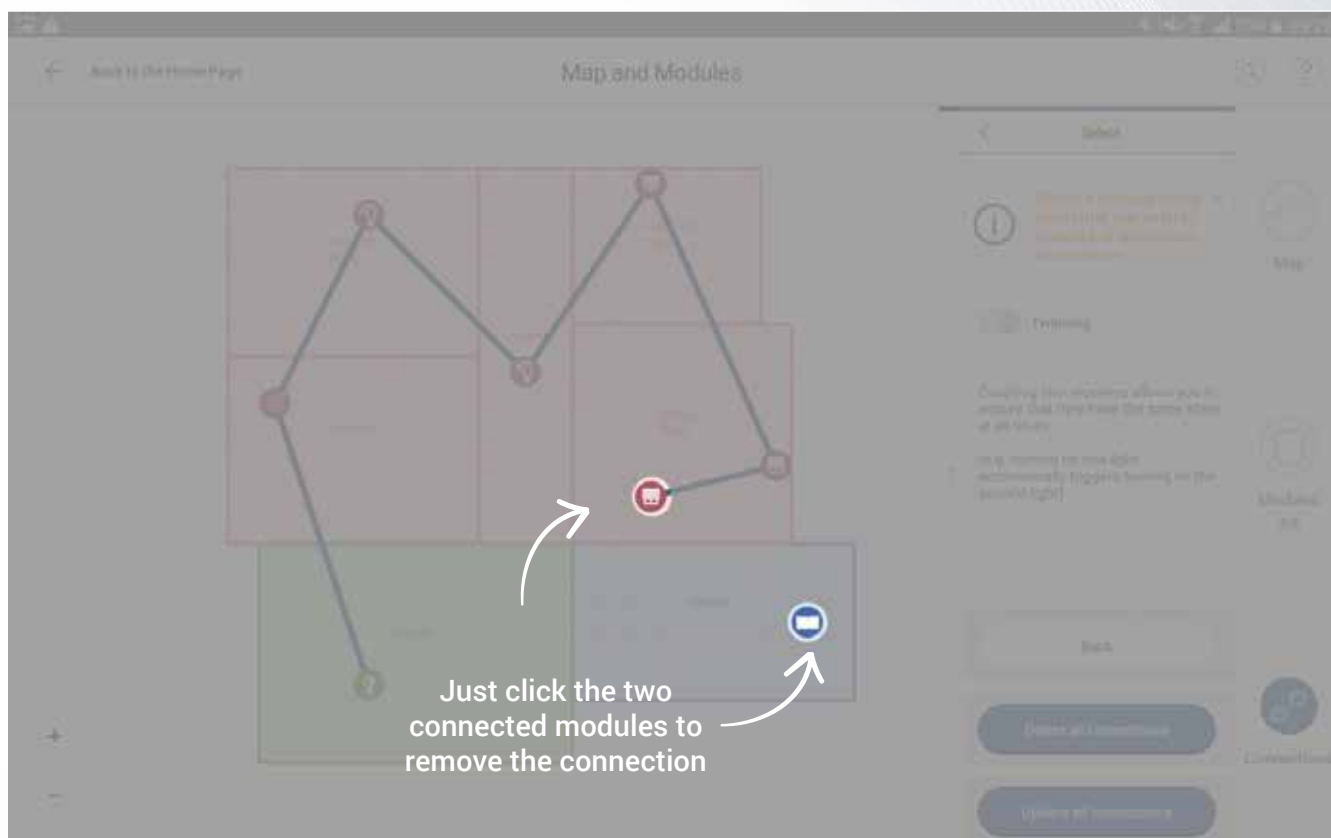

Automatic creation of the Radio Bus

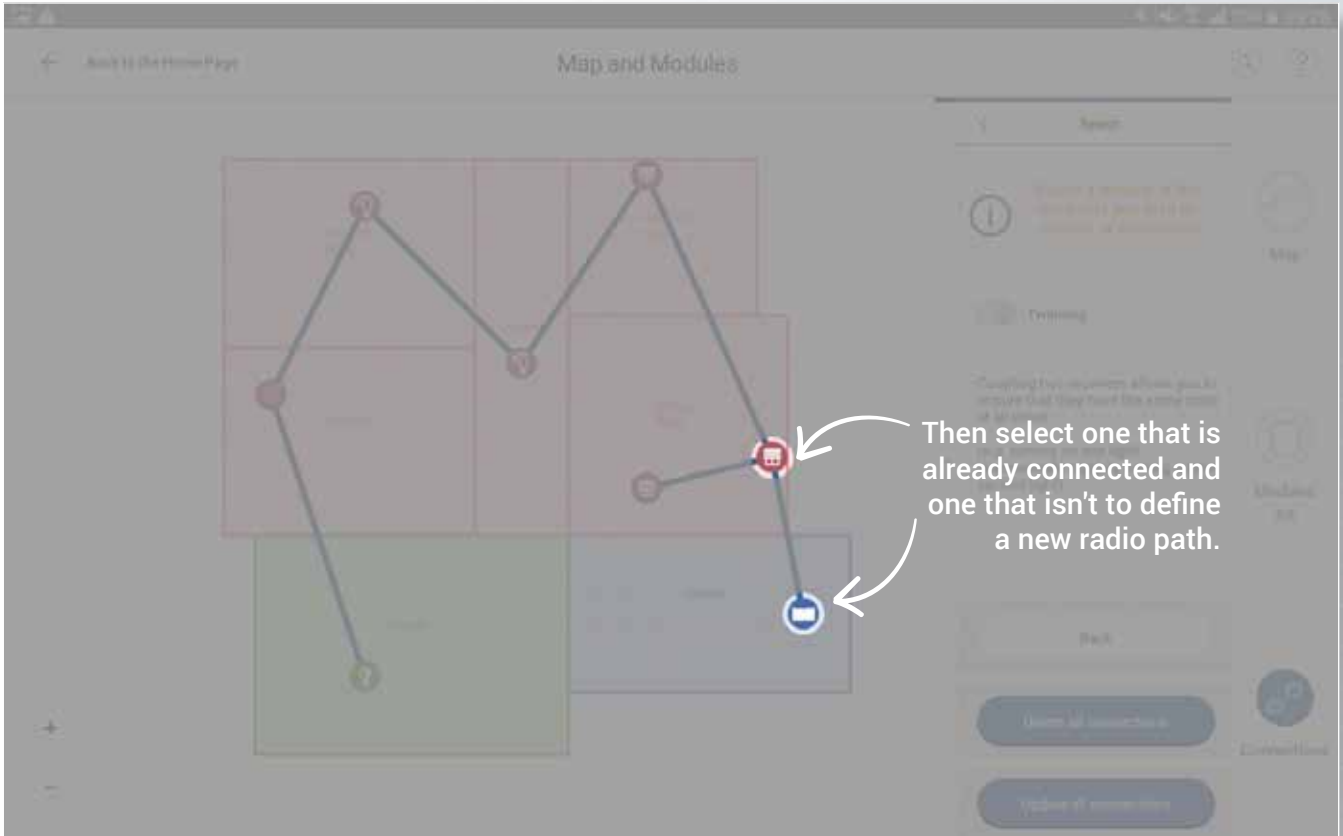

Creation of the Radio Bus

Manual creation of the Radio Bus

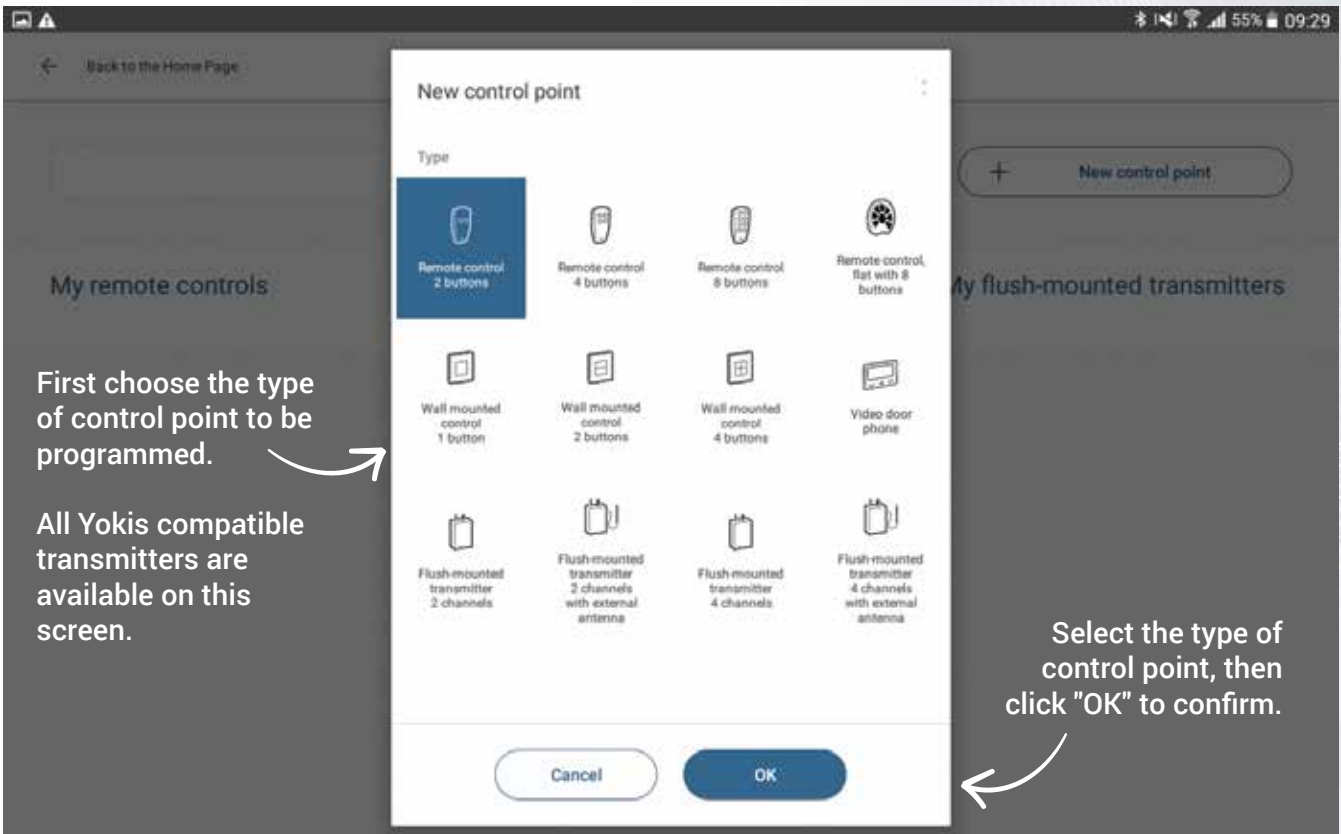

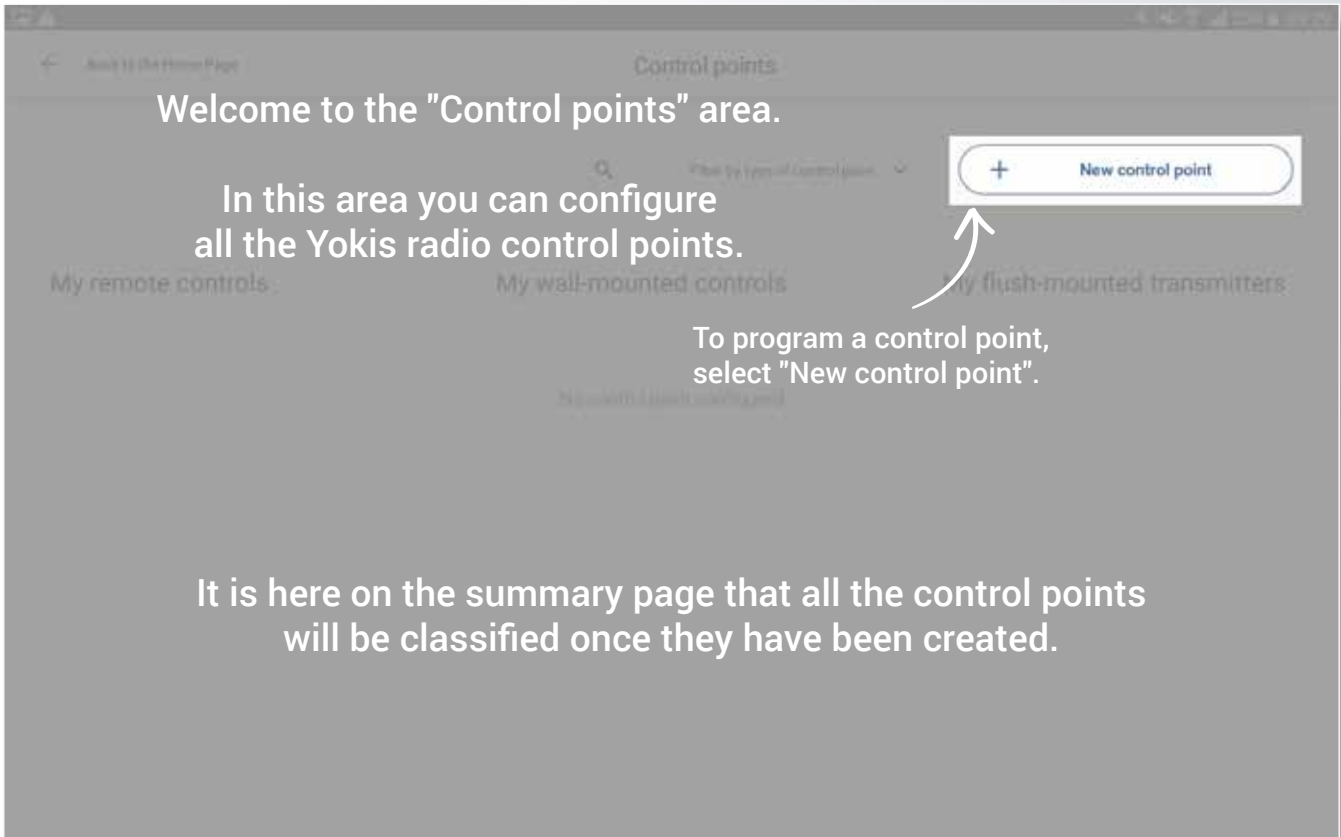

NOTE: The application does not allow you to create closed links, they must always be linear or star.

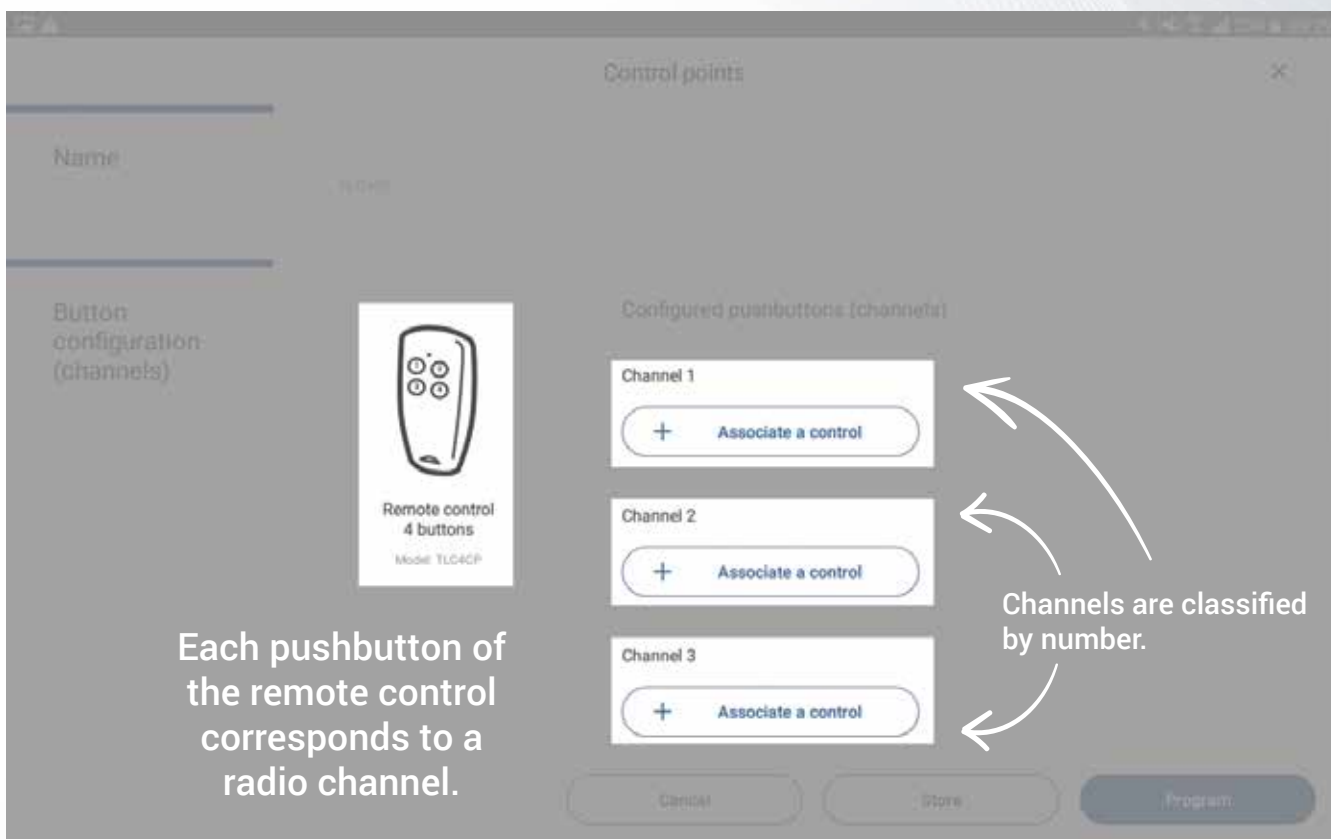

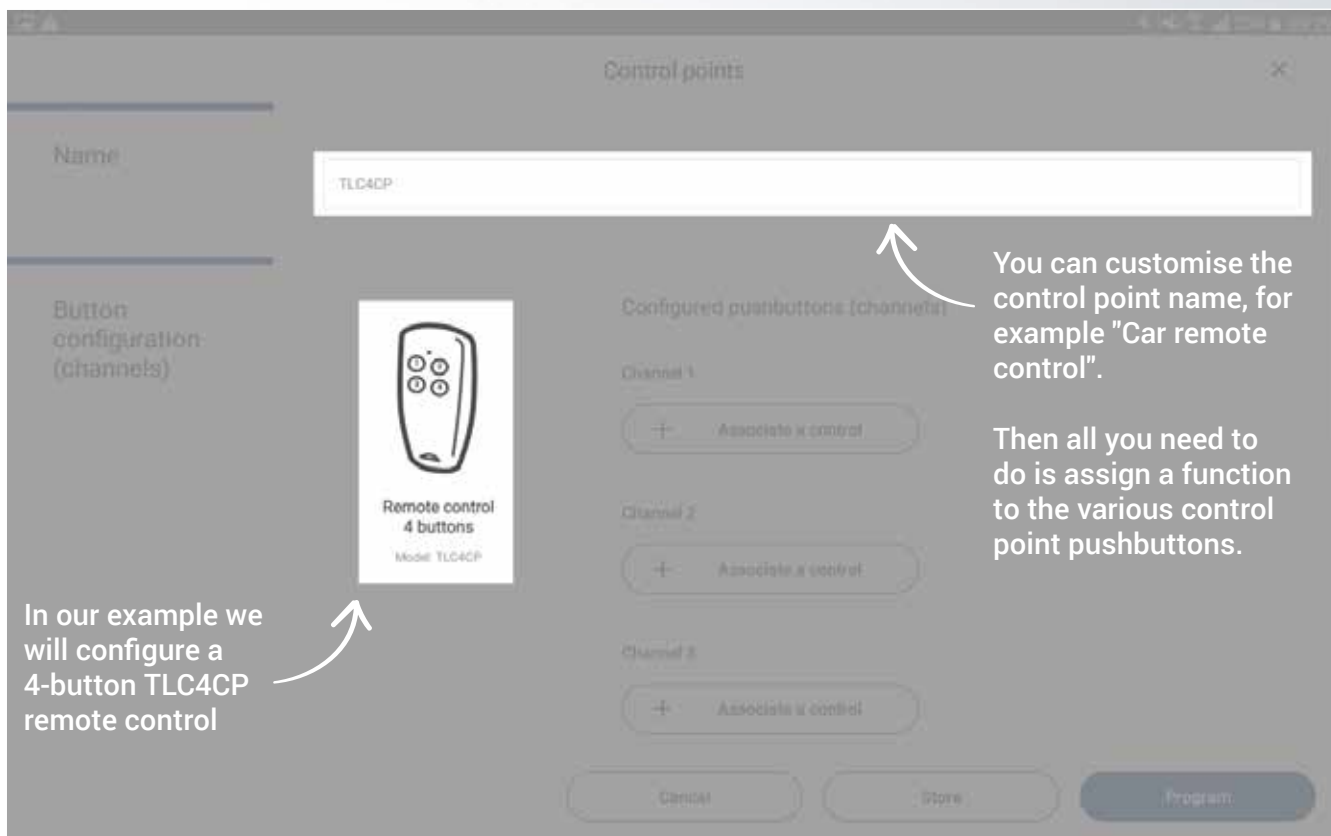

Configuration of the control points

Add new control points to the system

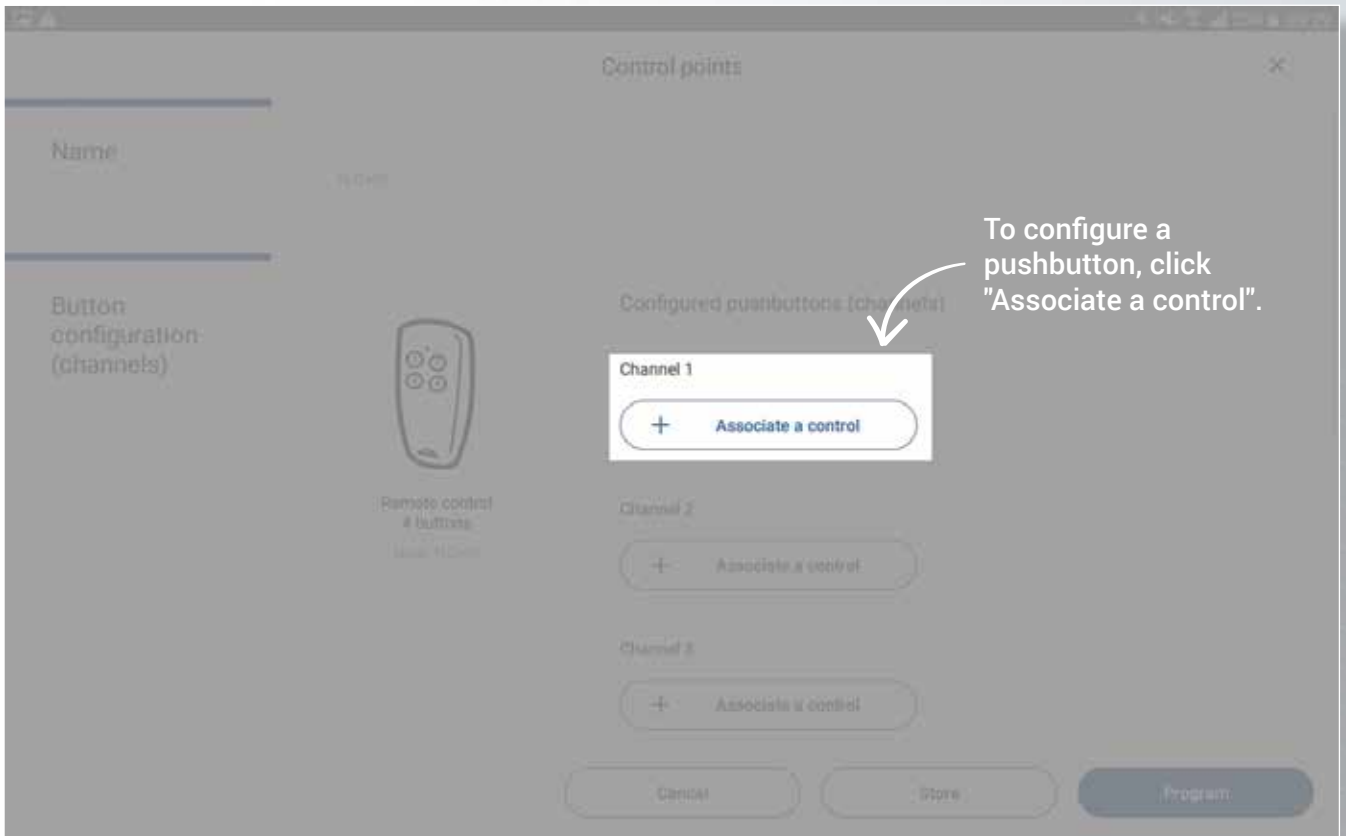

The configuration screen of a control point is then displayed.

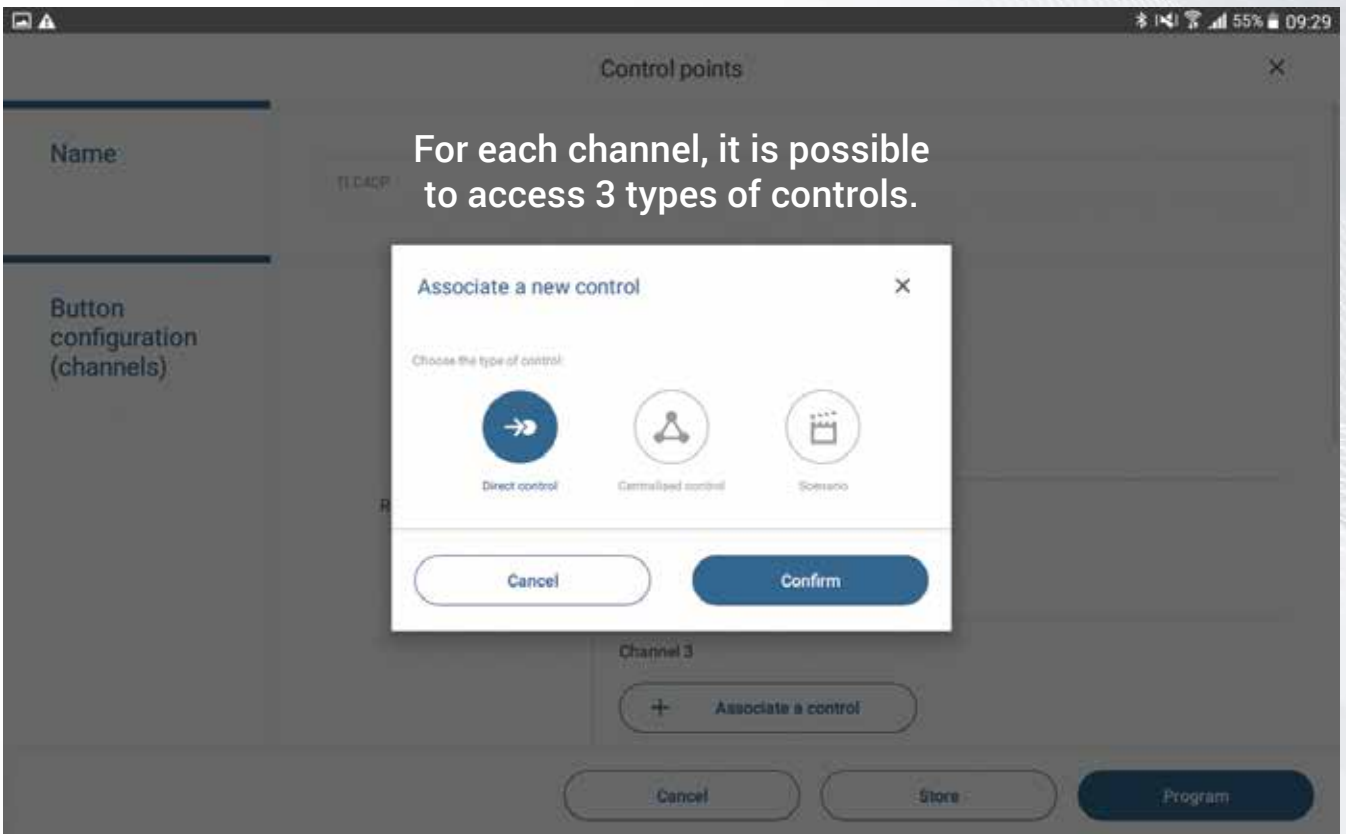

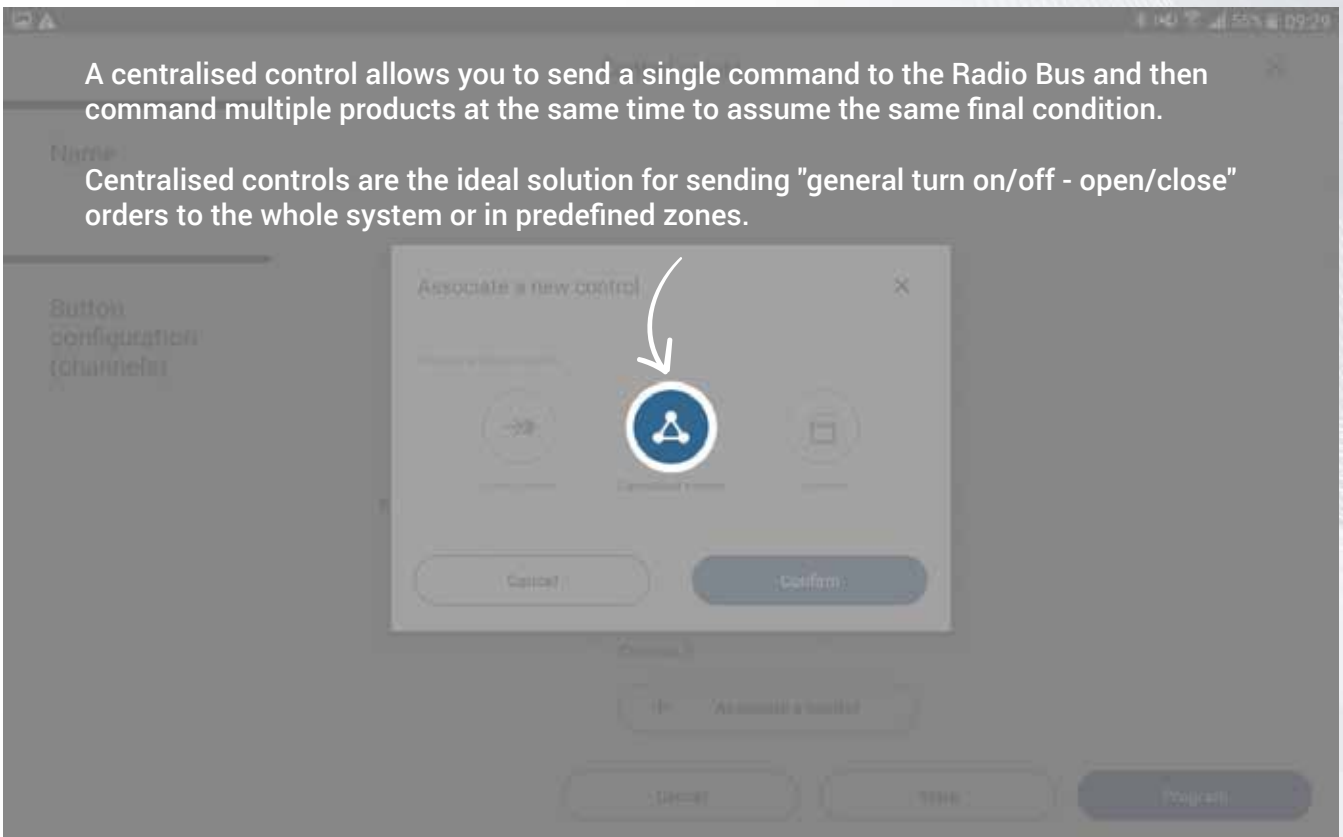

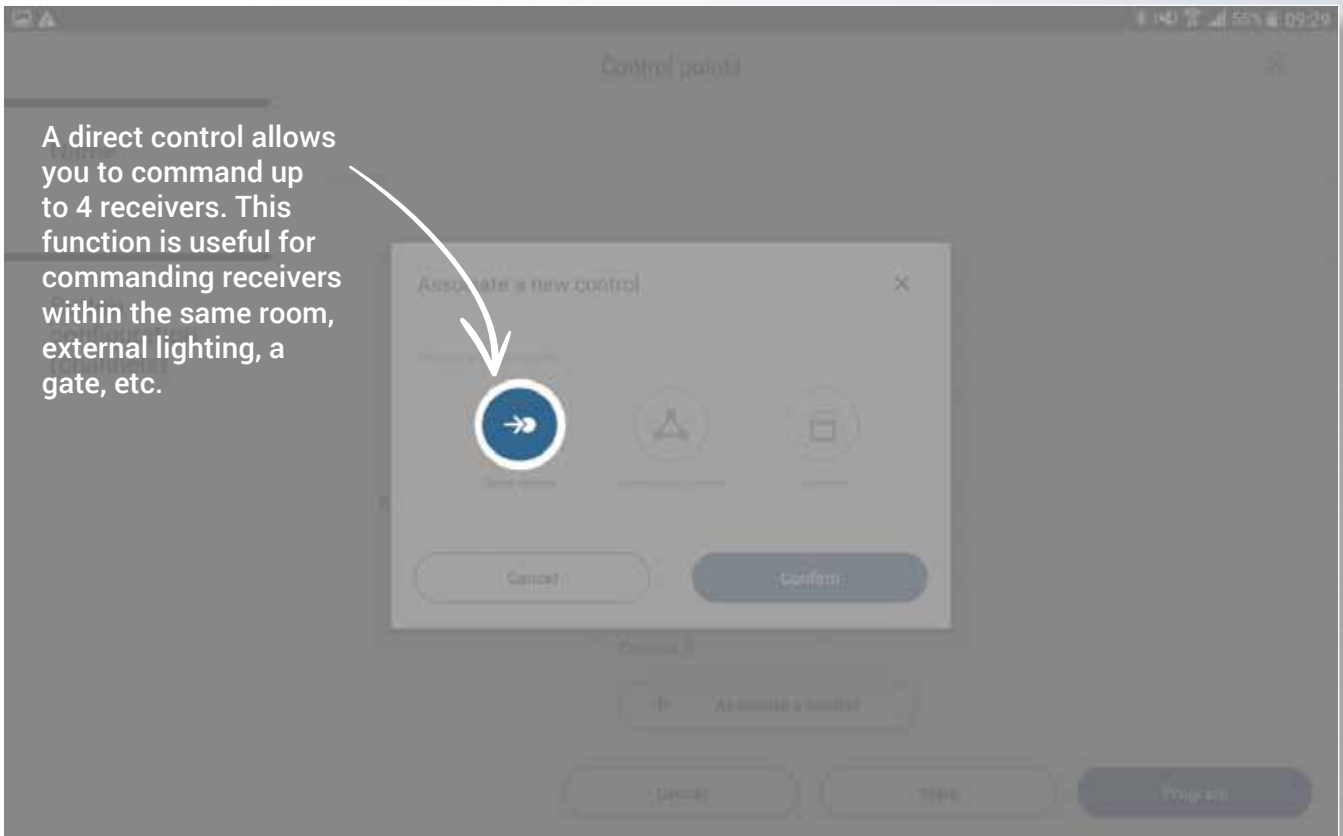

The design of the remote control is also a reminder of channel numbers to locate them more easily.

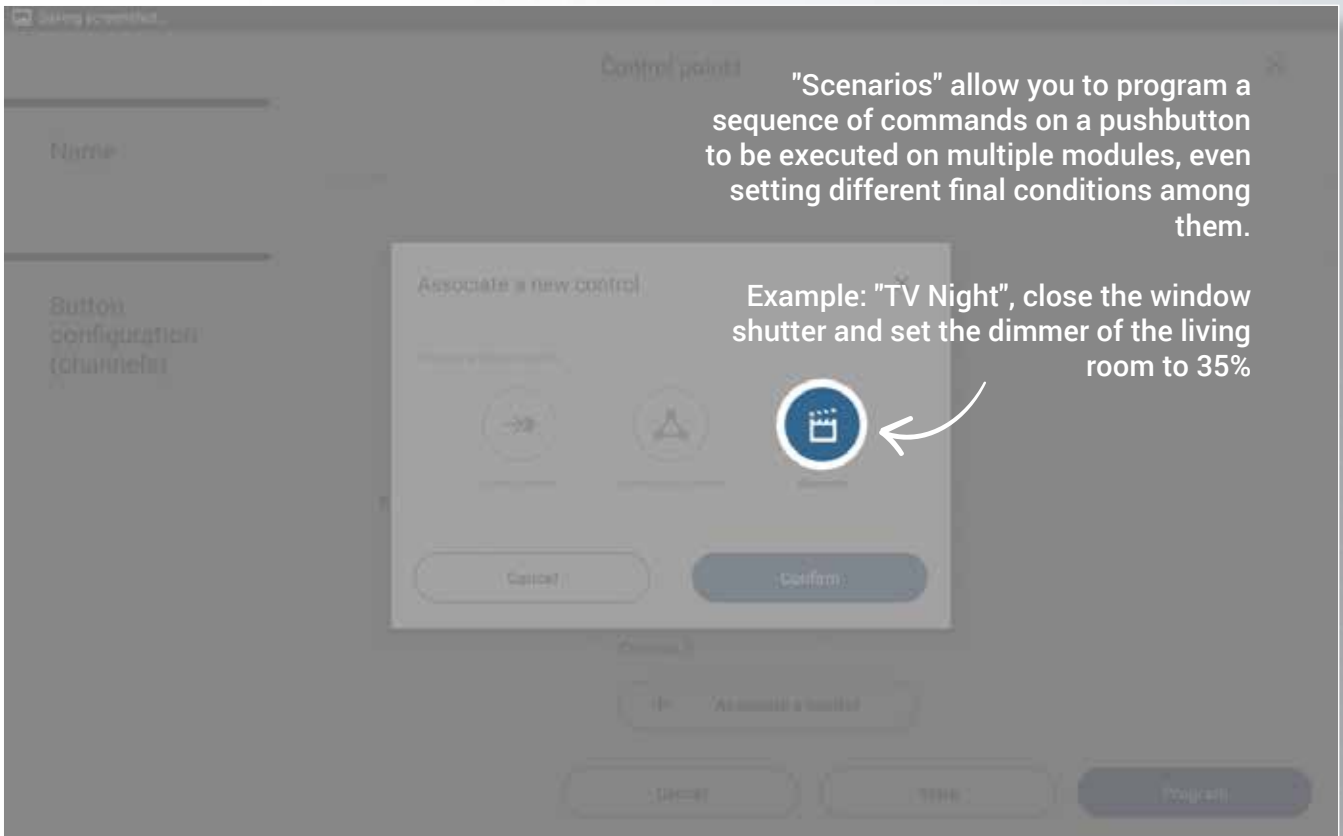

Configuration of the control points

The different types of configuration for a transmitter channel

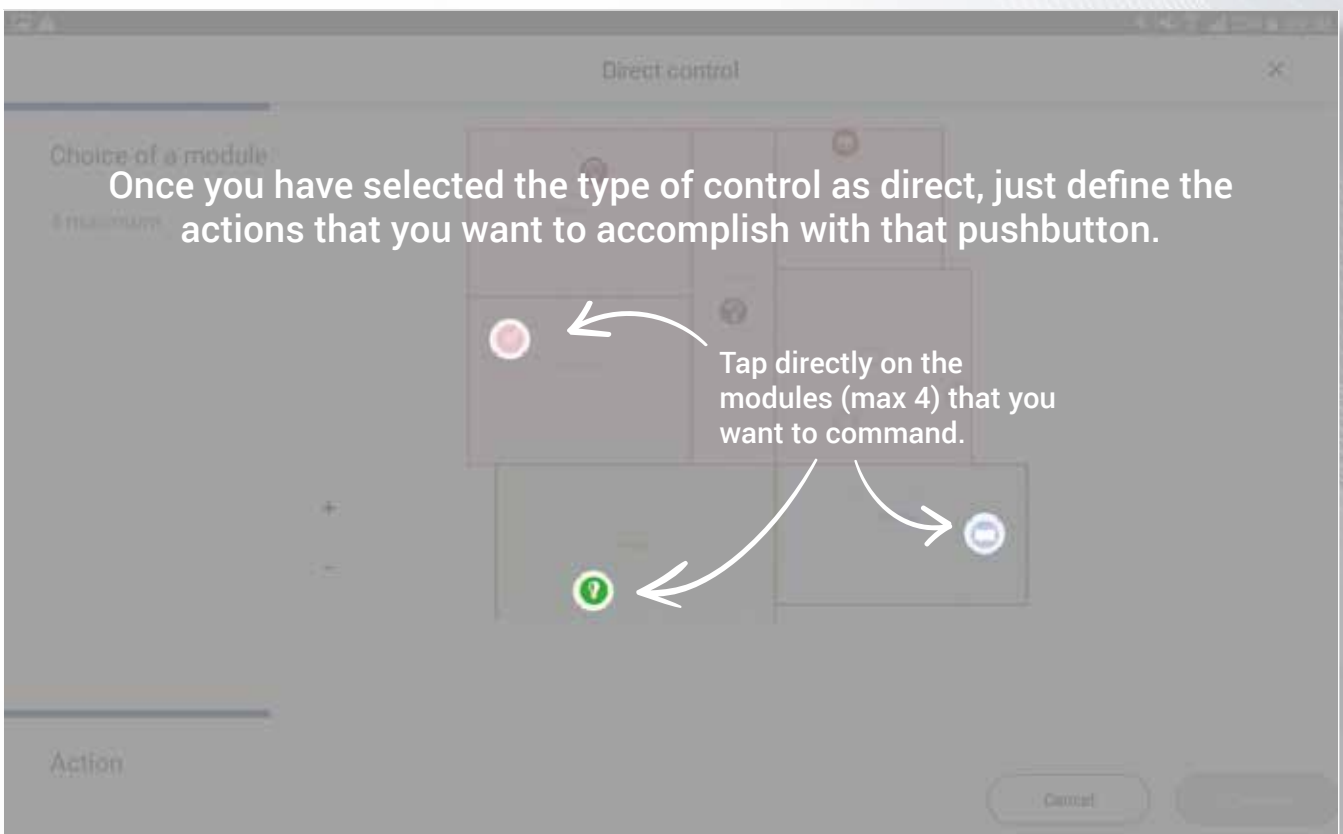

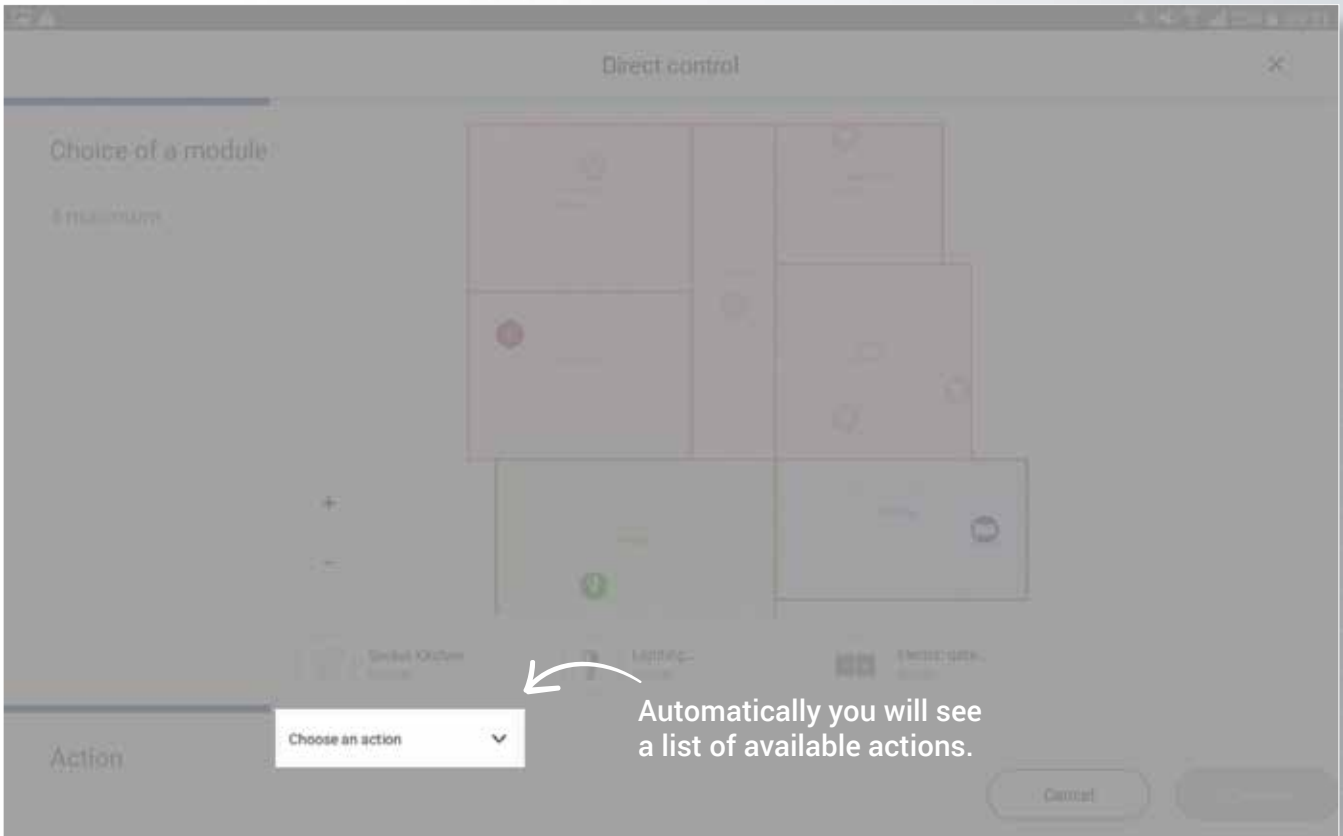

Note: to activate scenarios the system must be equipped with the Yokis Hub.

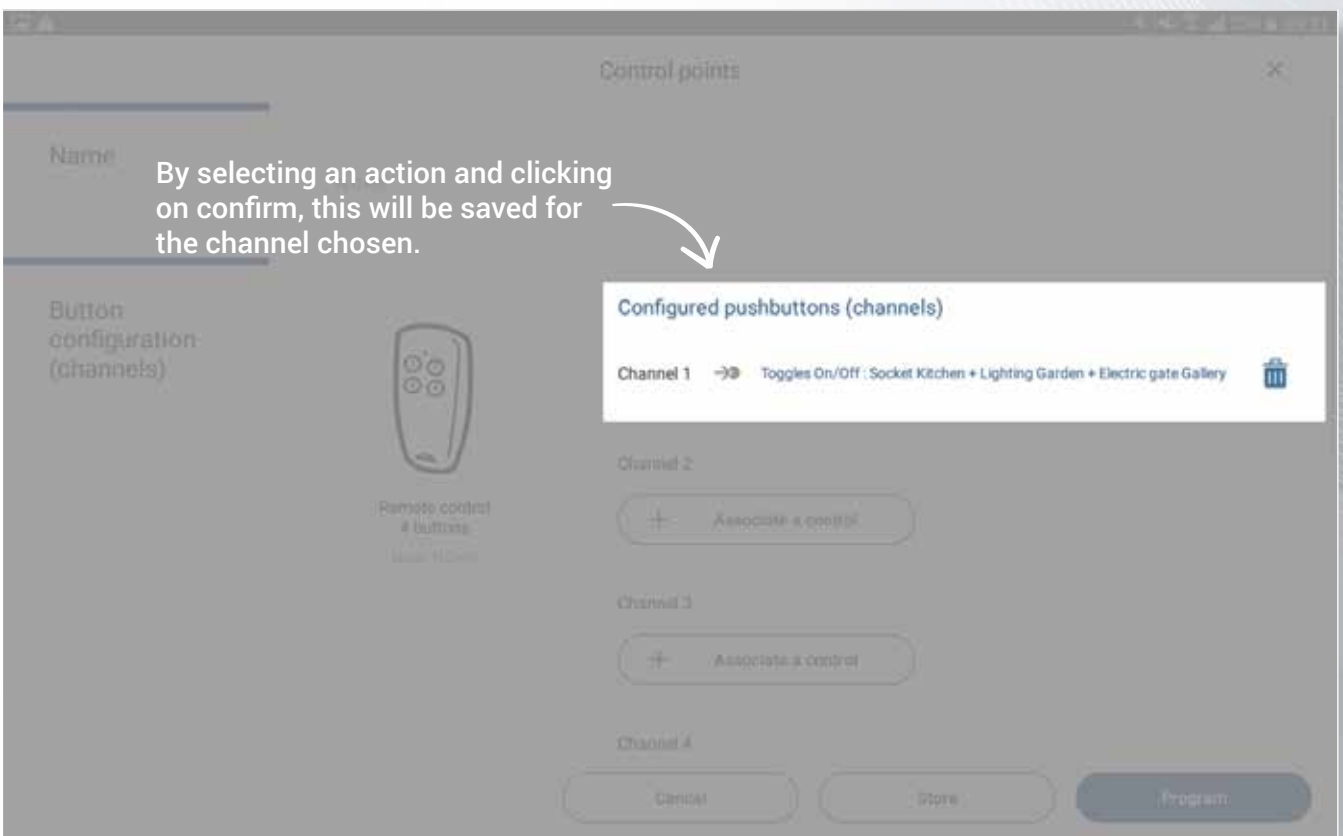

Configuration of the control points

Direct controls

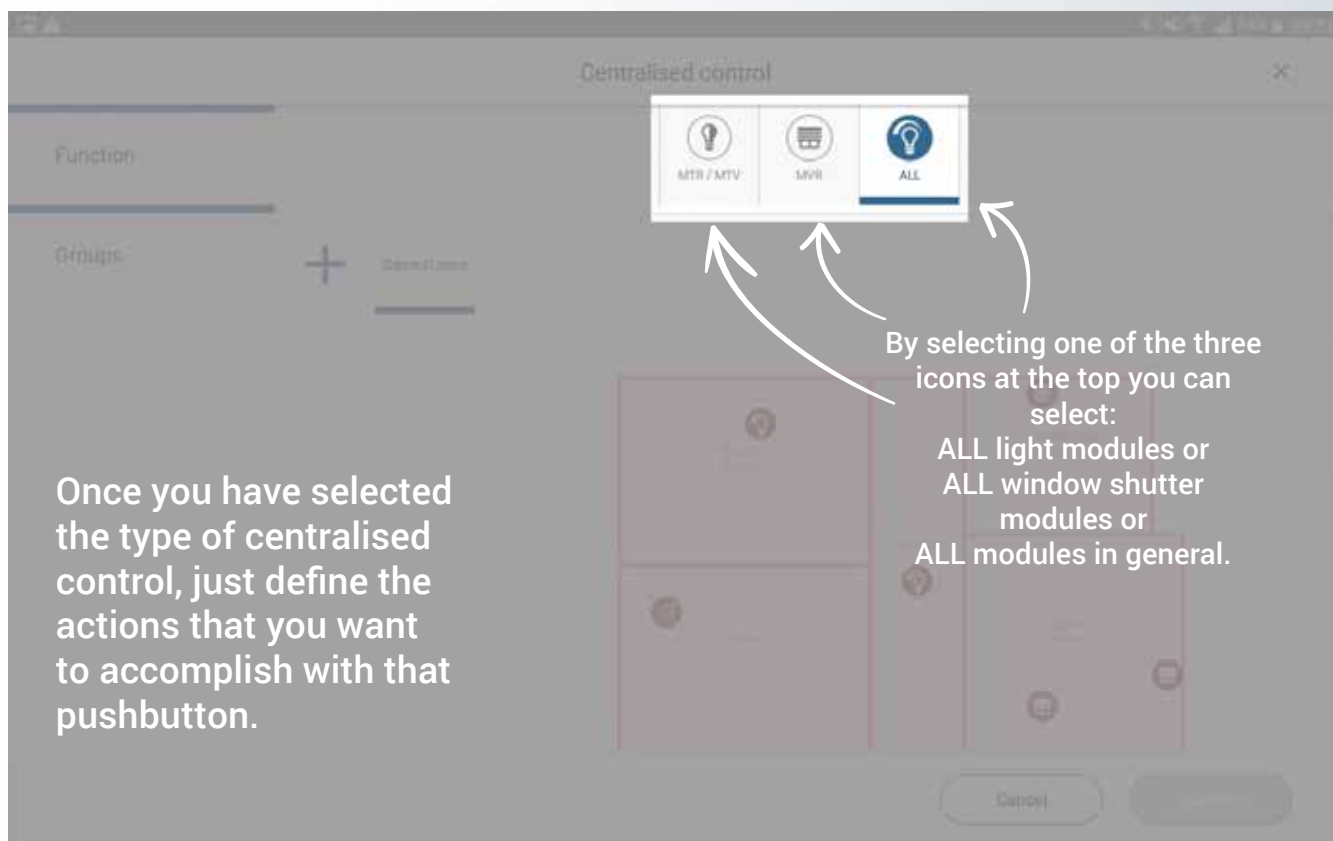

This list of possible actions is generated based on the selected products.
 By selecting different kinds of transmitters, the list of possible actions will only propose those that can be implemented by both types.

Configuration of the control points

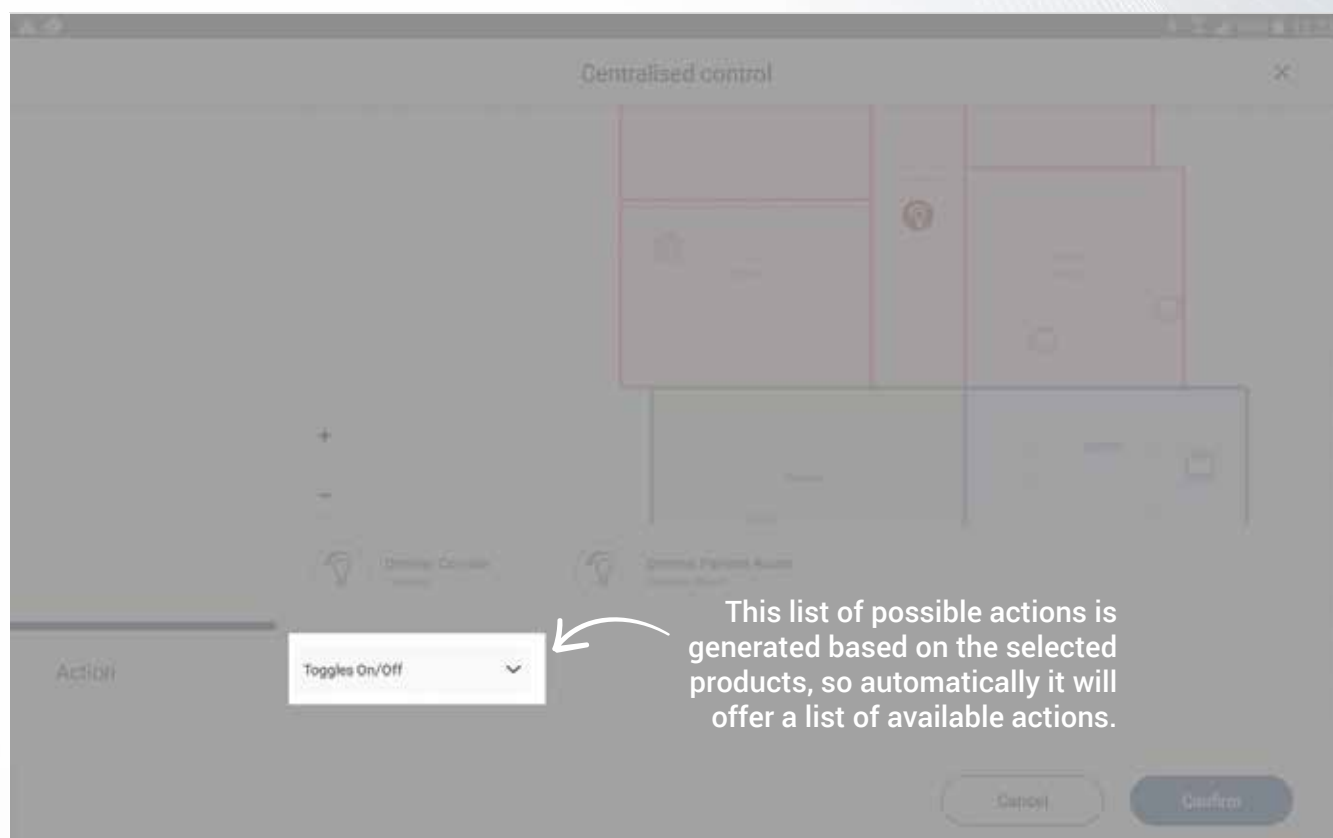

Centralised controls

Once you have selected the type of centralised control, just define the actions that you want to accomplish with that pushbutton.

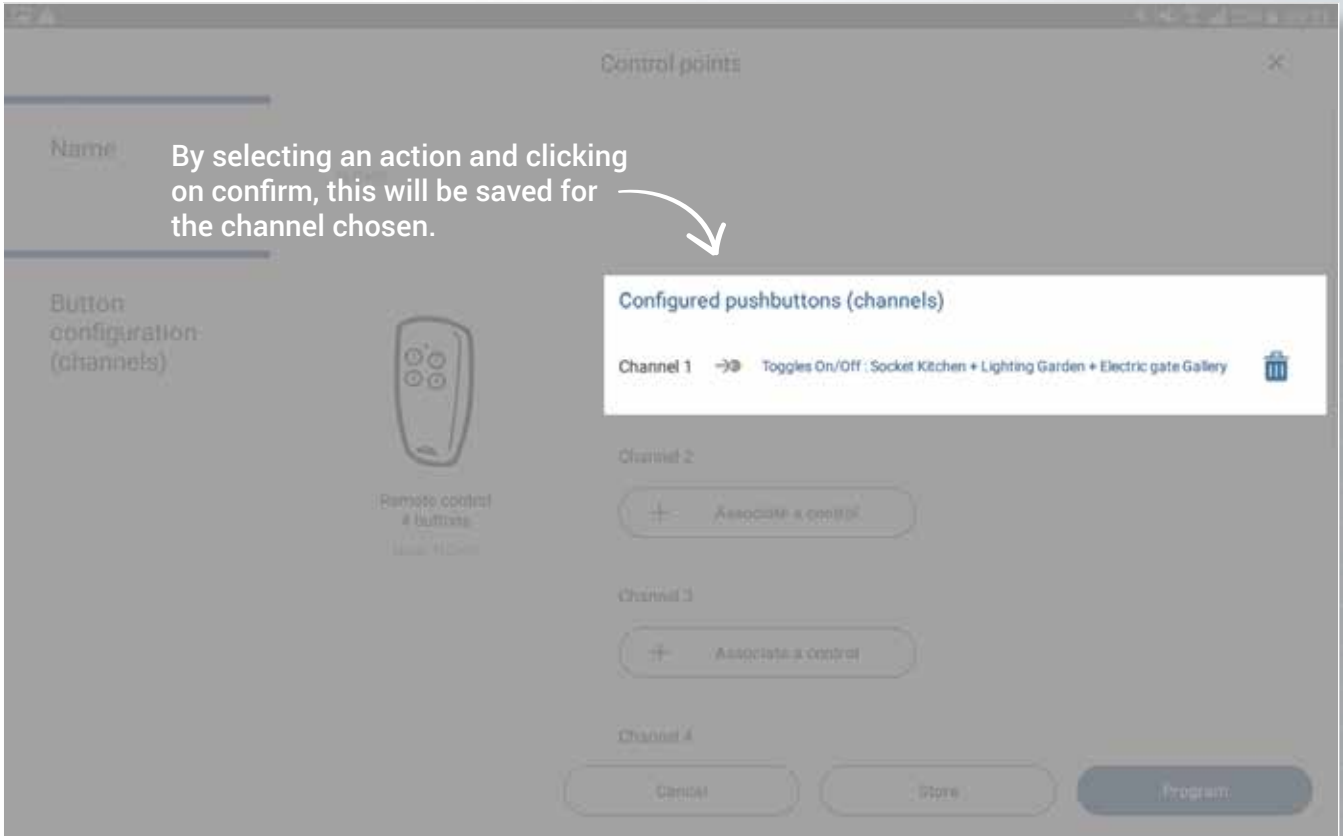

By selecting one of the three icons at the top you can select:
ALL light modules or
ALL window shutter modules or
ALL modules in general.

The screenshot shows a 'Centralised control' window with a 'Function' section and a 'Groups' section. A dropdown menu is open, showing three icons: a lightbulb for 'MTR / MTV', a window shutter for 'MVR', and a lightbulb for 'ALL'. The 'ALL' option is currently selected. Below the dropdown, there are several dimmed control panels representing different groups of modules.

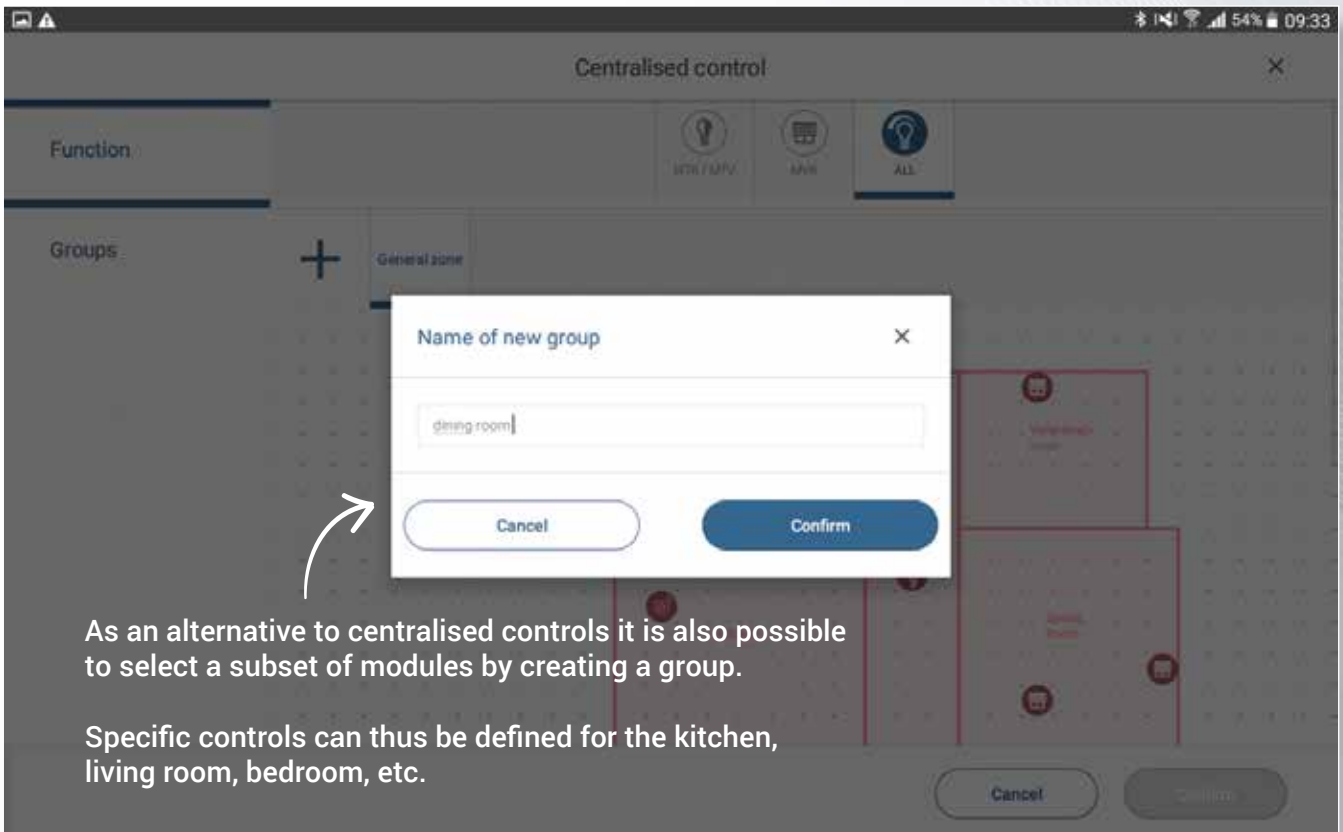

This list of possible actions is generated based on the selected products, so automatically it will offer a list of available actions.

The screenshot shows the same 'Centralised control' window, but now the 'Action' section is visible. A dropdown menu is open, showing a list of actions. The first action is 'Toggles On/Off'. Below the dropdown, there are two dimmed control panels, each with a lightbulb icon and a label: 'Dimmer Control' and 'Dimmer Programm. Switch'.

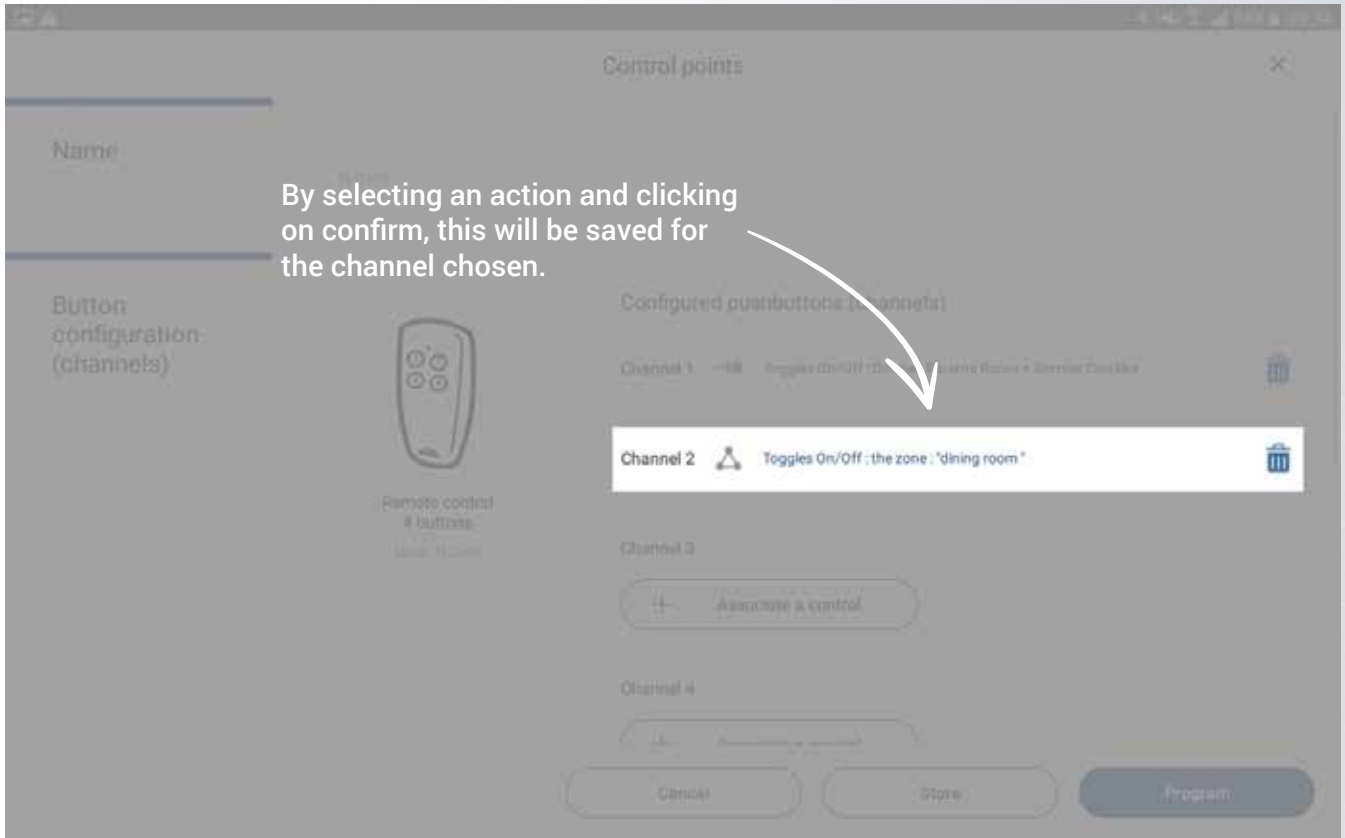

Configuration of the control points

Group controls

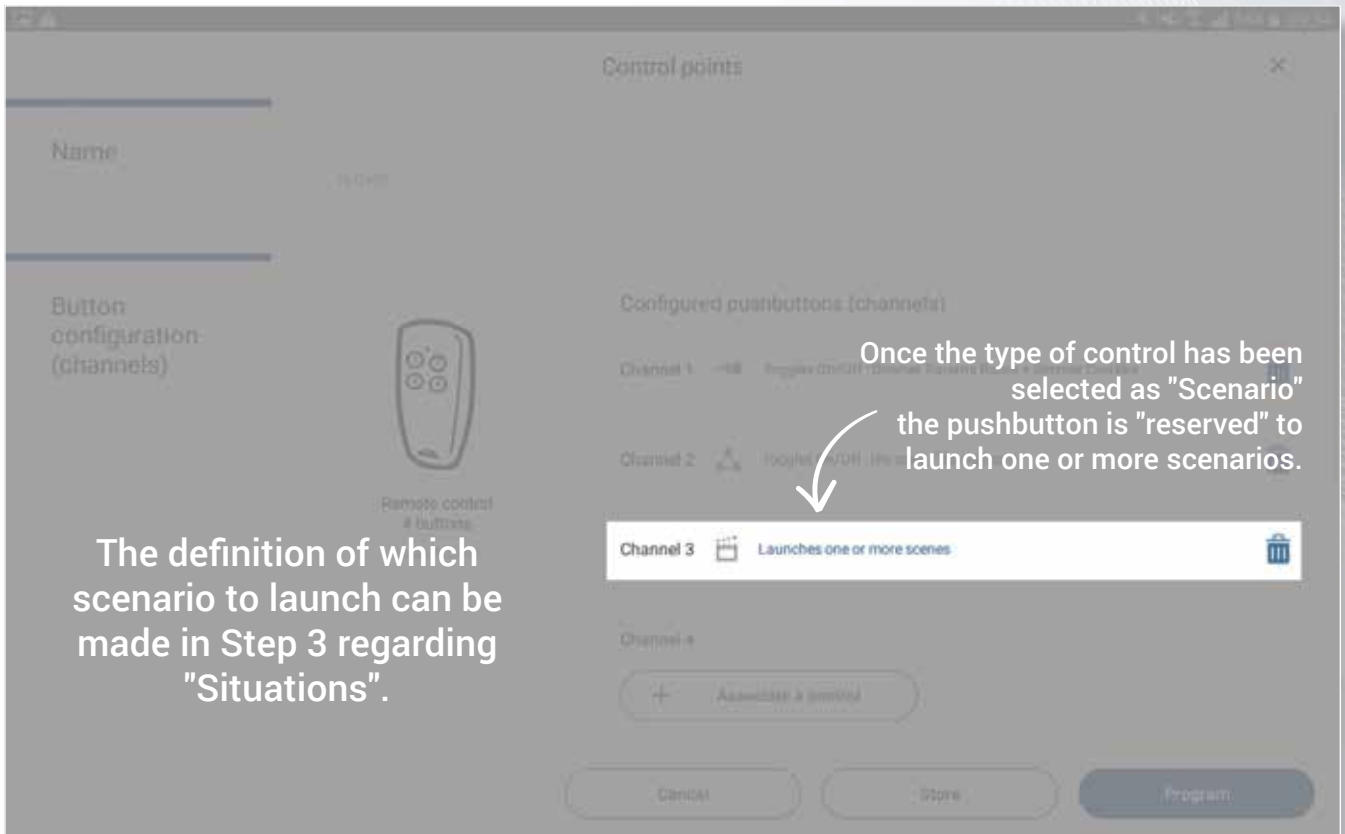

As an alternative to centralised controls it is also possible to select a subset of modules by creating a group.

Specific controls can thus be defined for the kitchen, living room, bedroom, etc.

Configuration of the control points

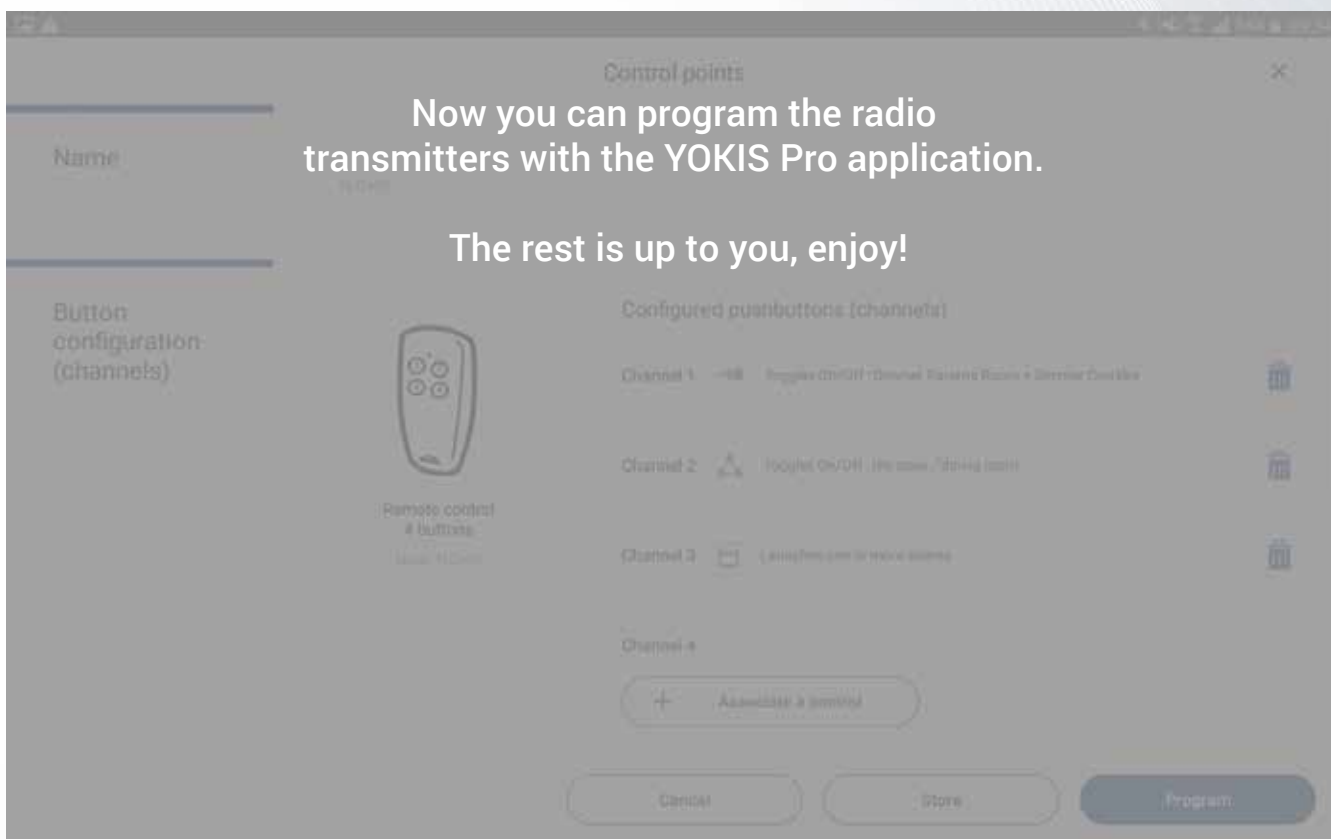

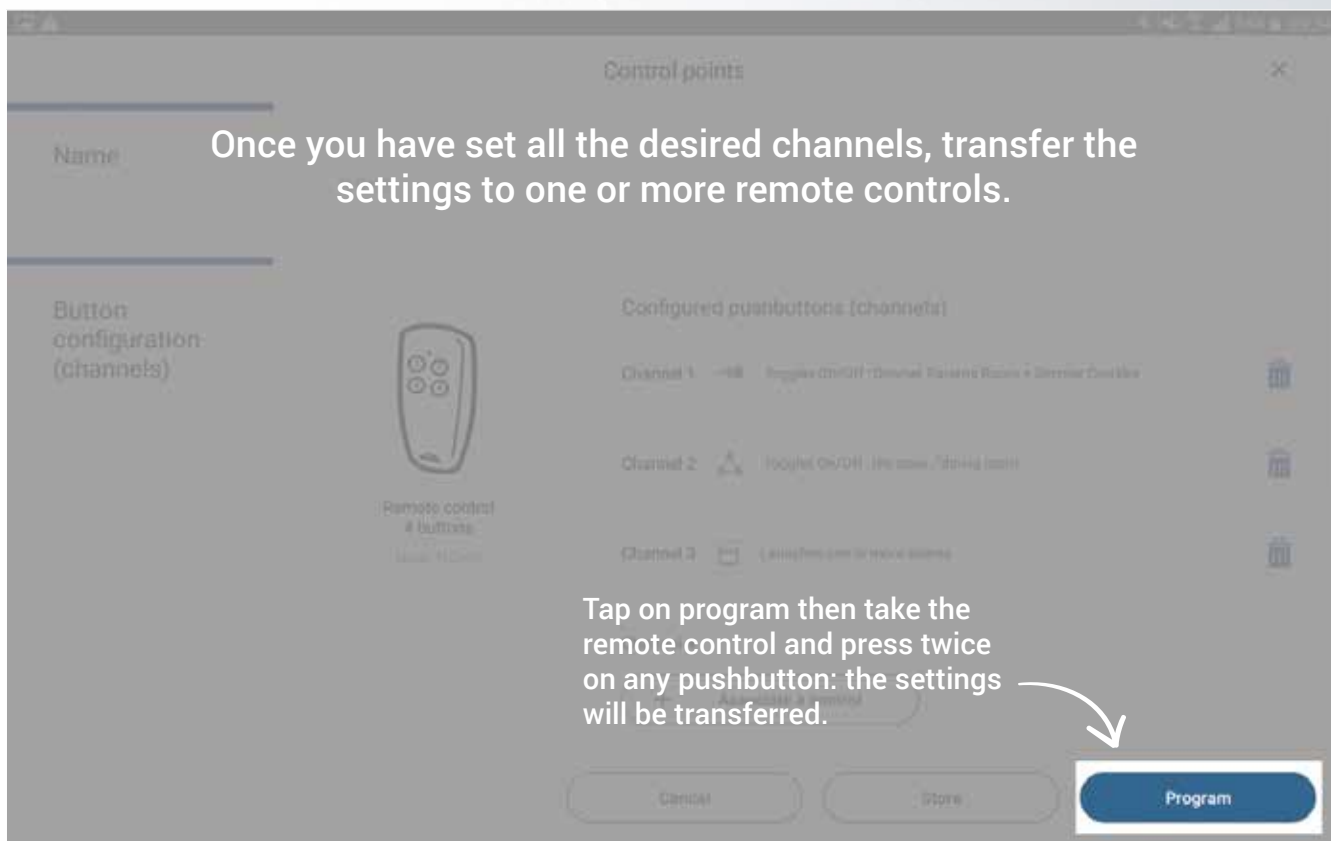

Scenario controls

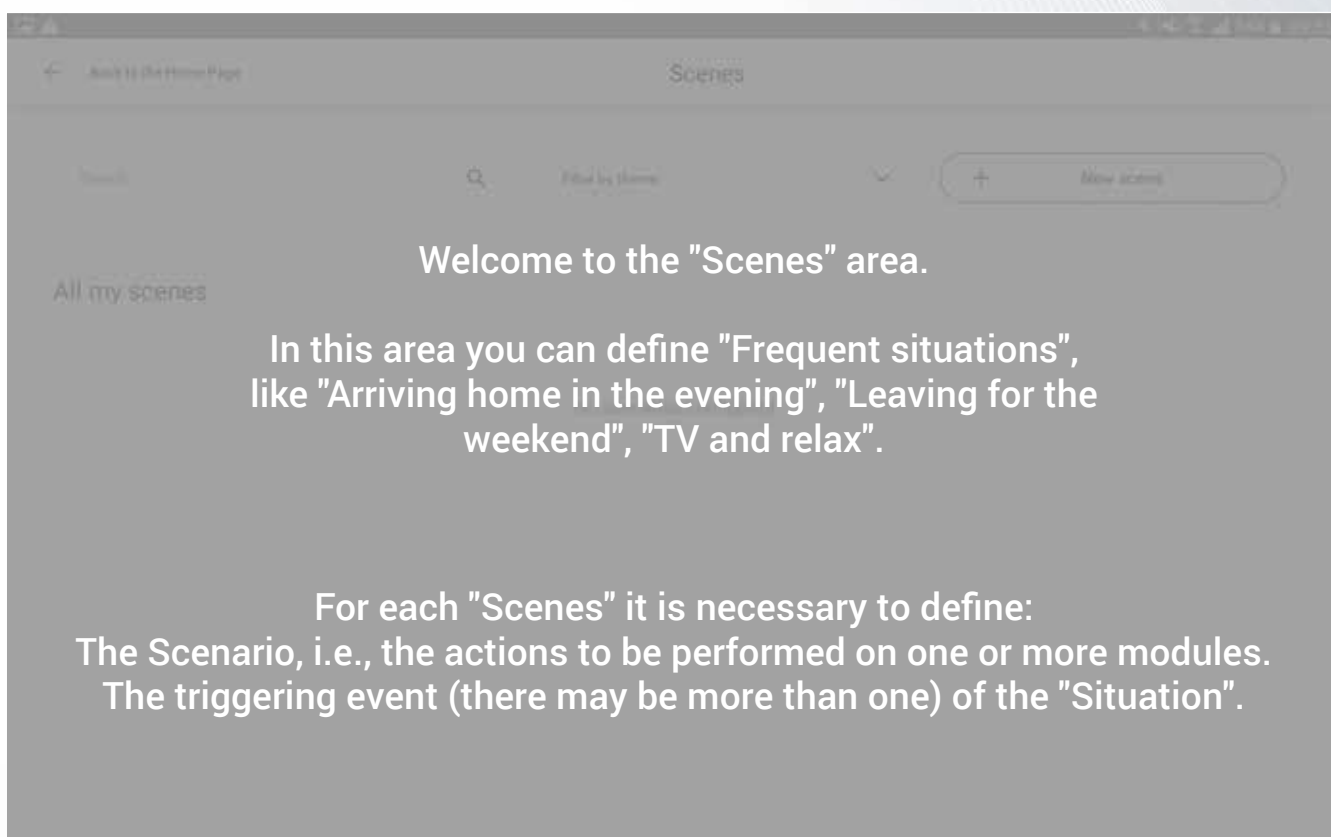

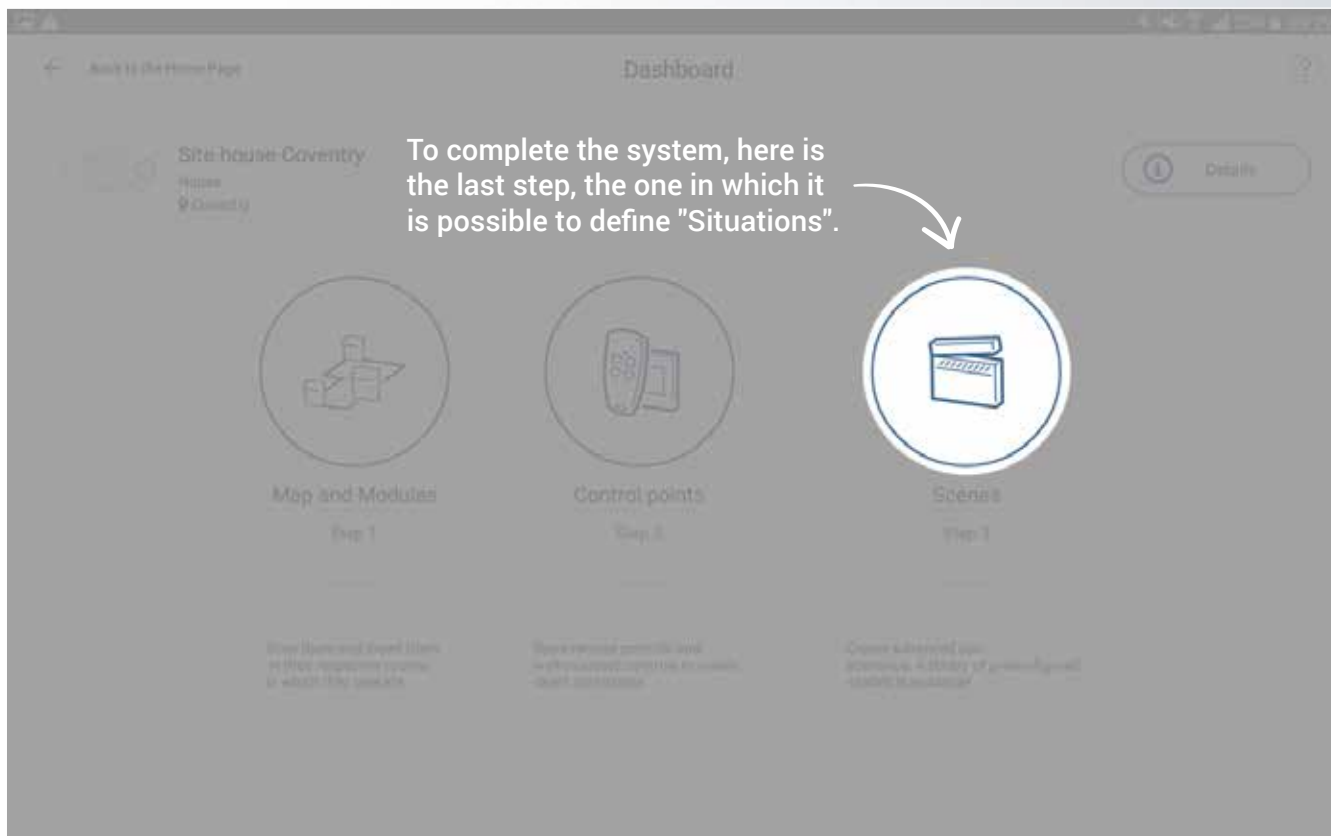

Configuration of the control points

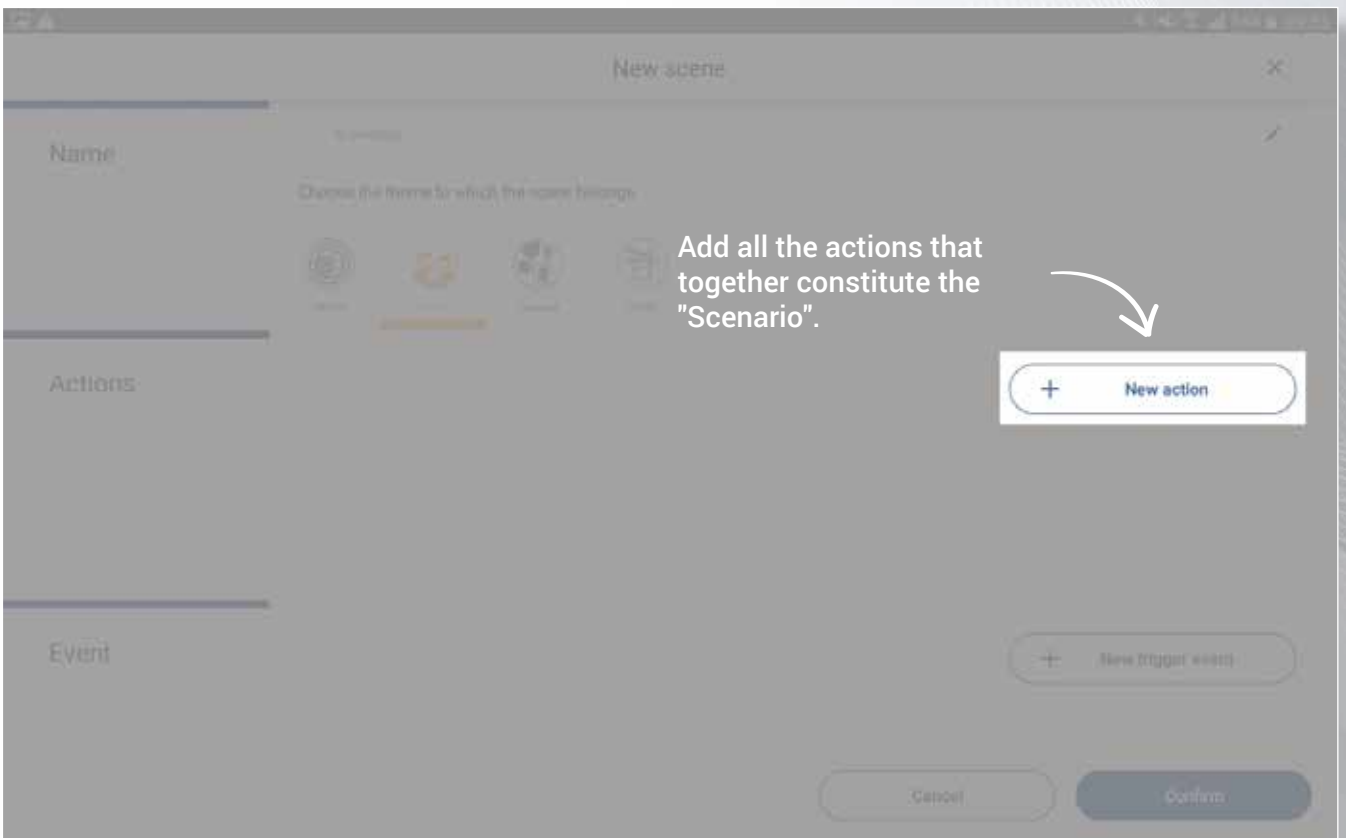

Transfer to remote controls

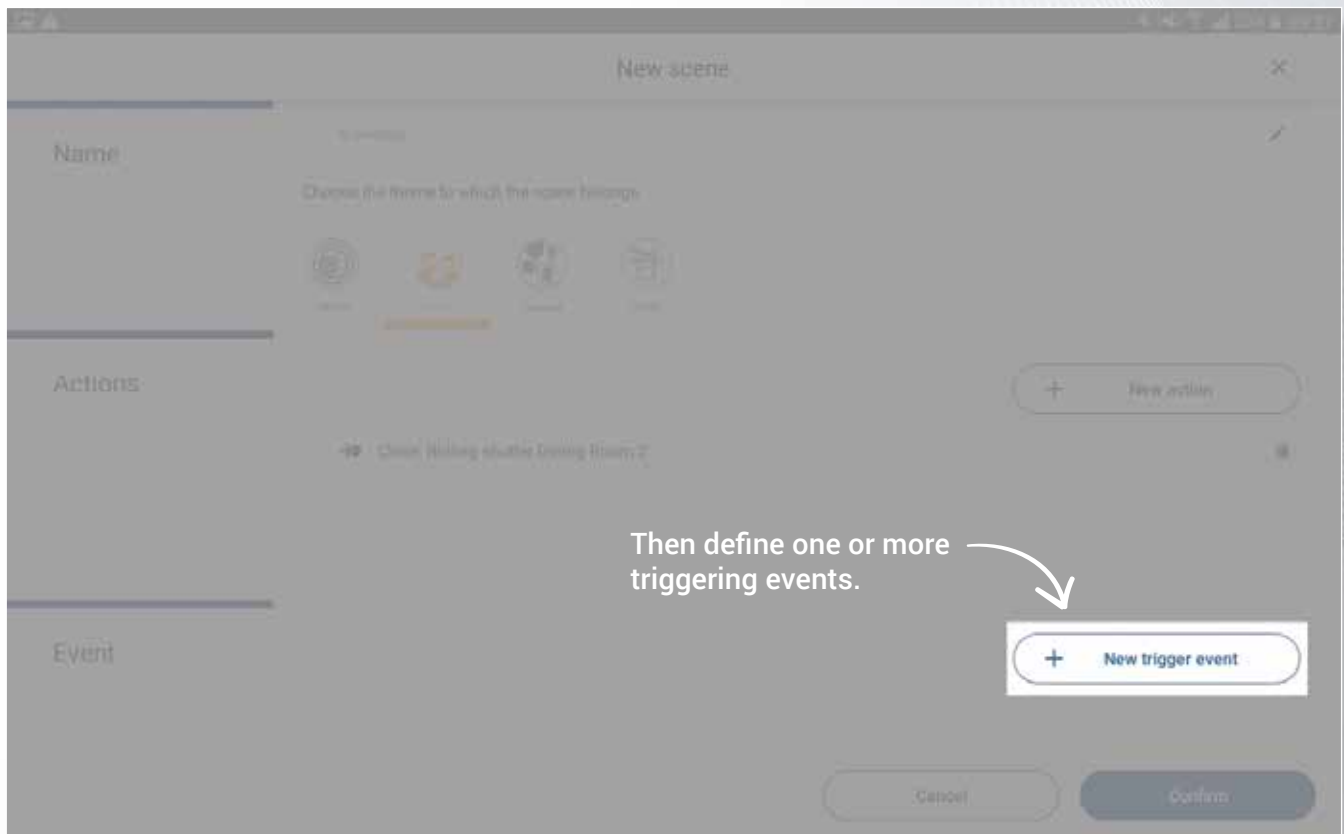

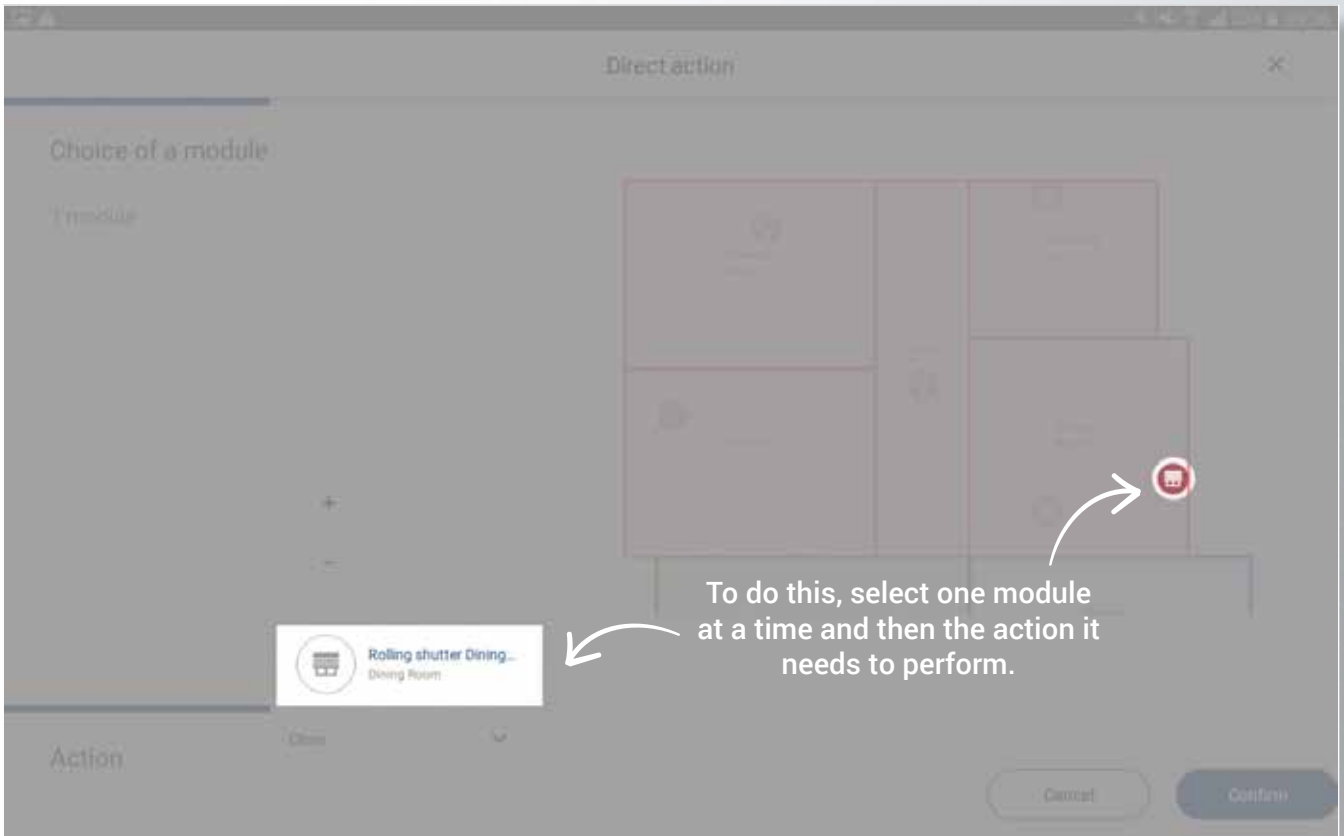

Warning: make sure the transmitters are version 5.

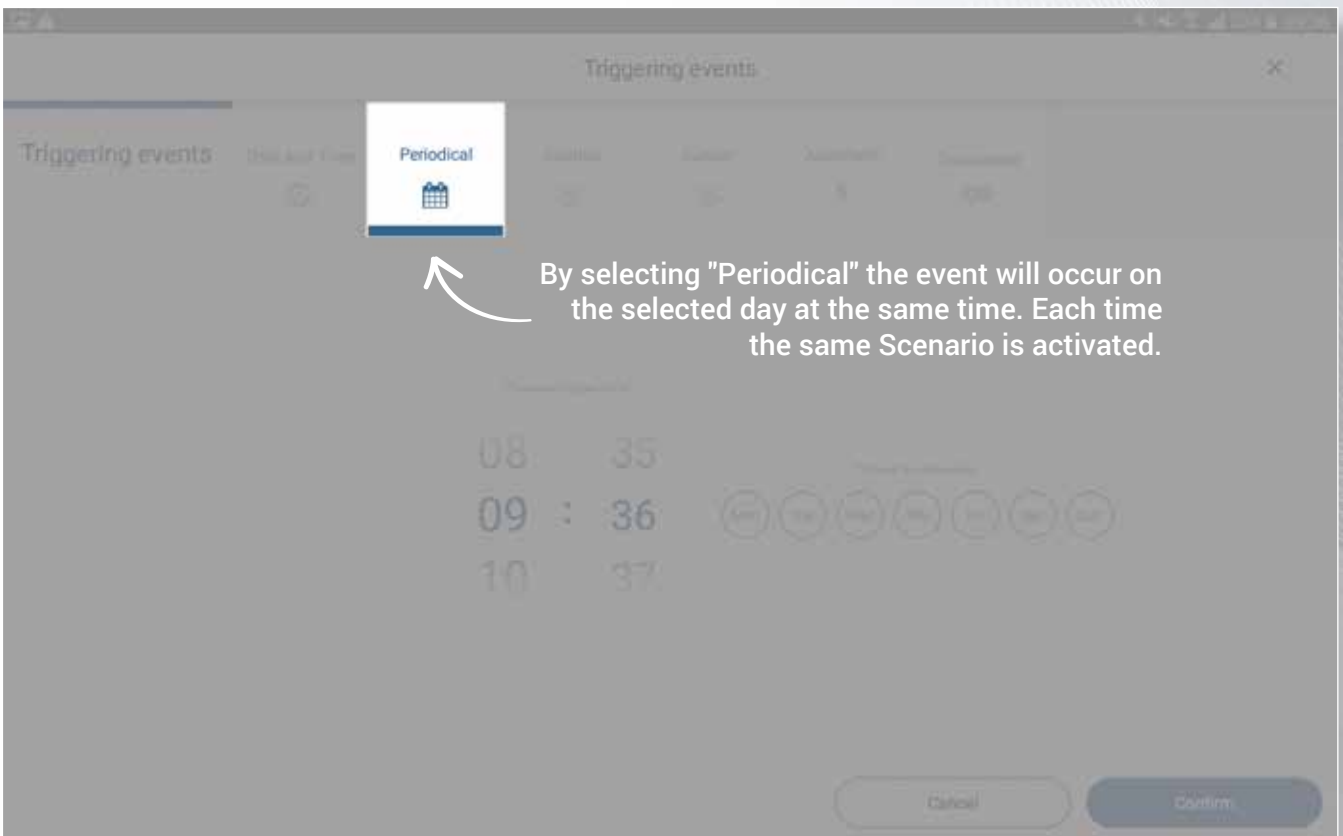

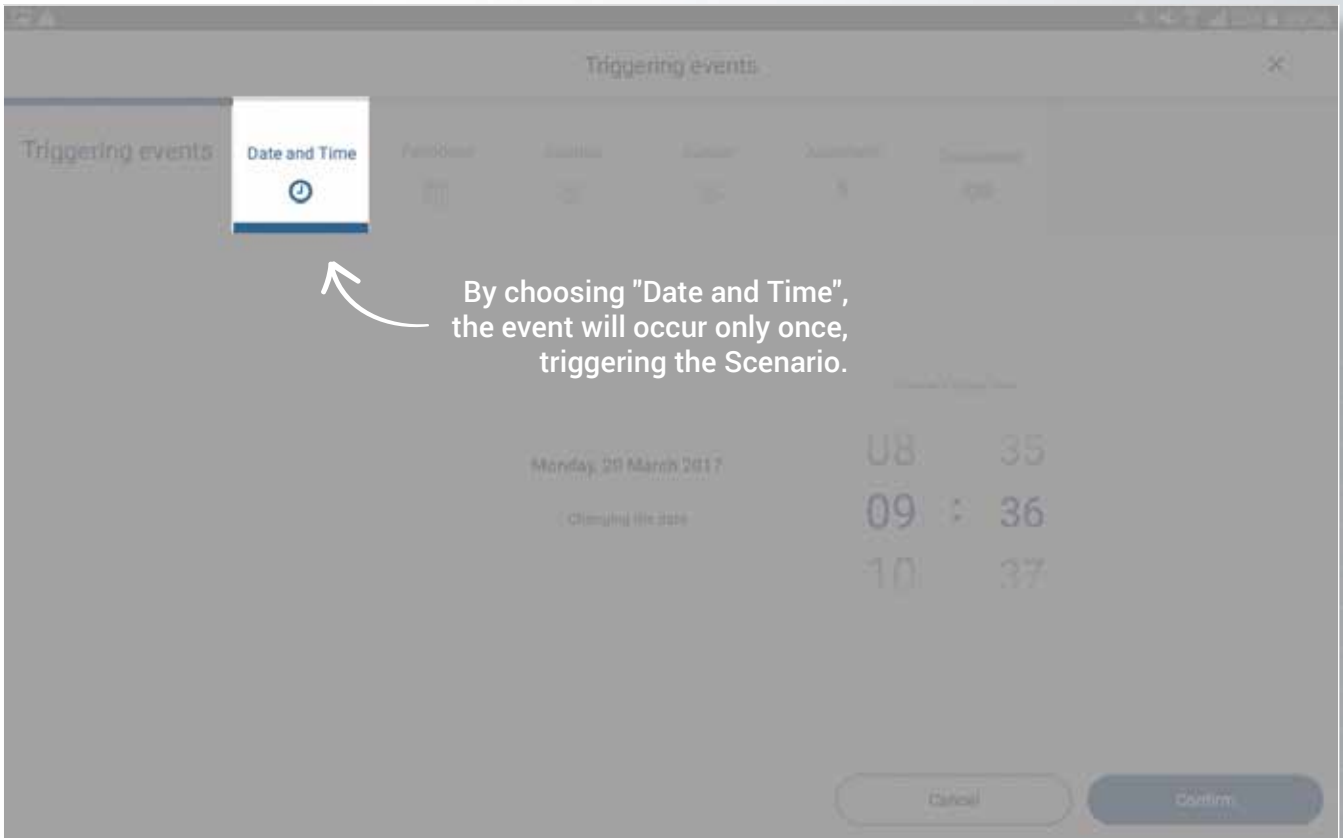

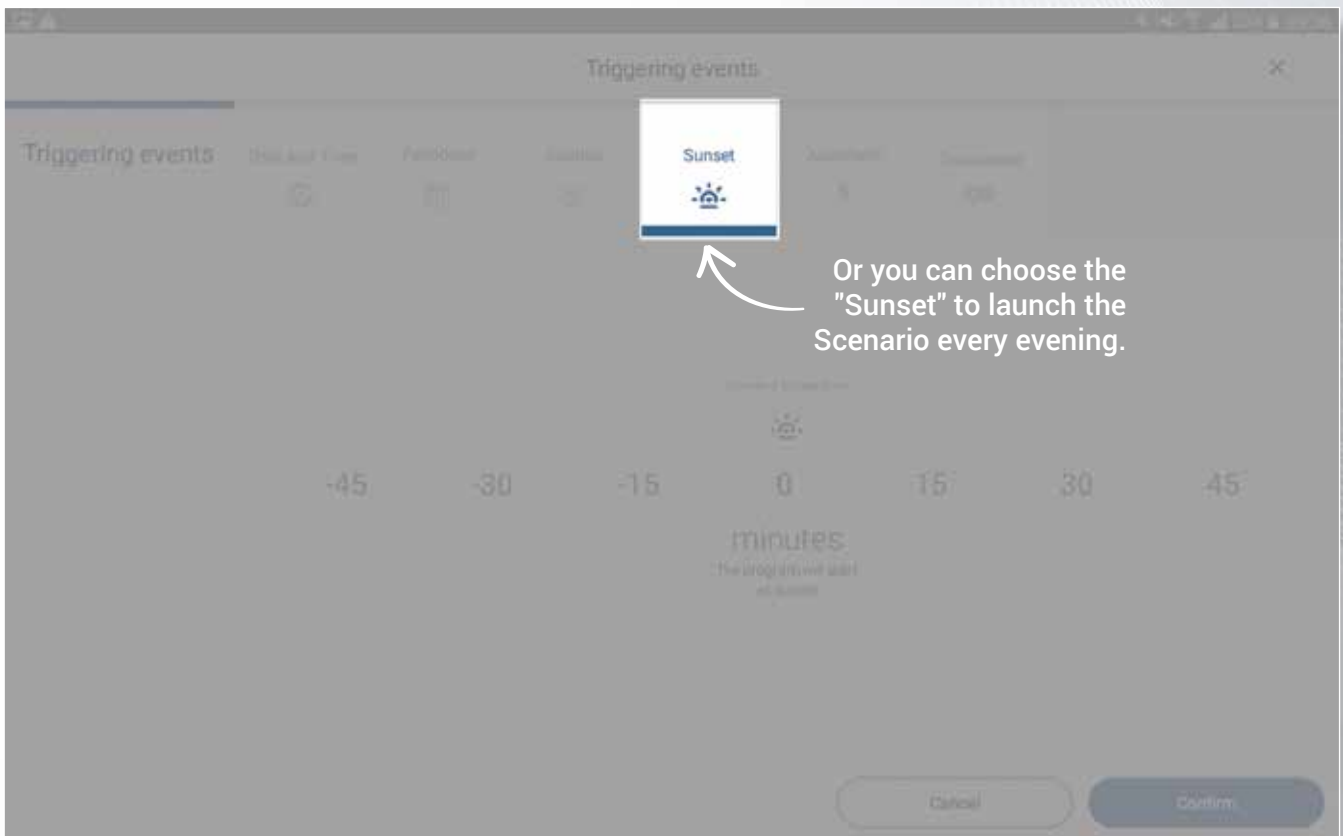

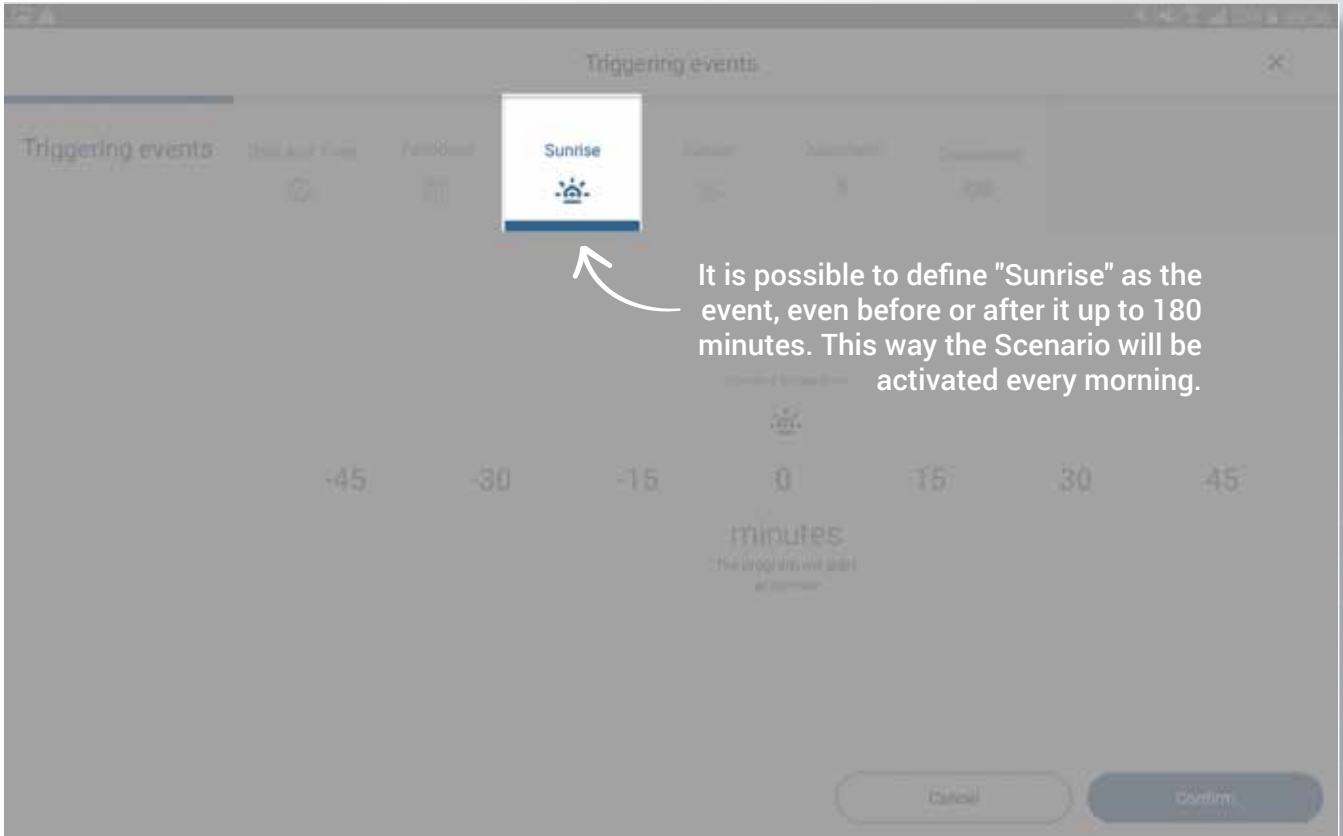

Situations

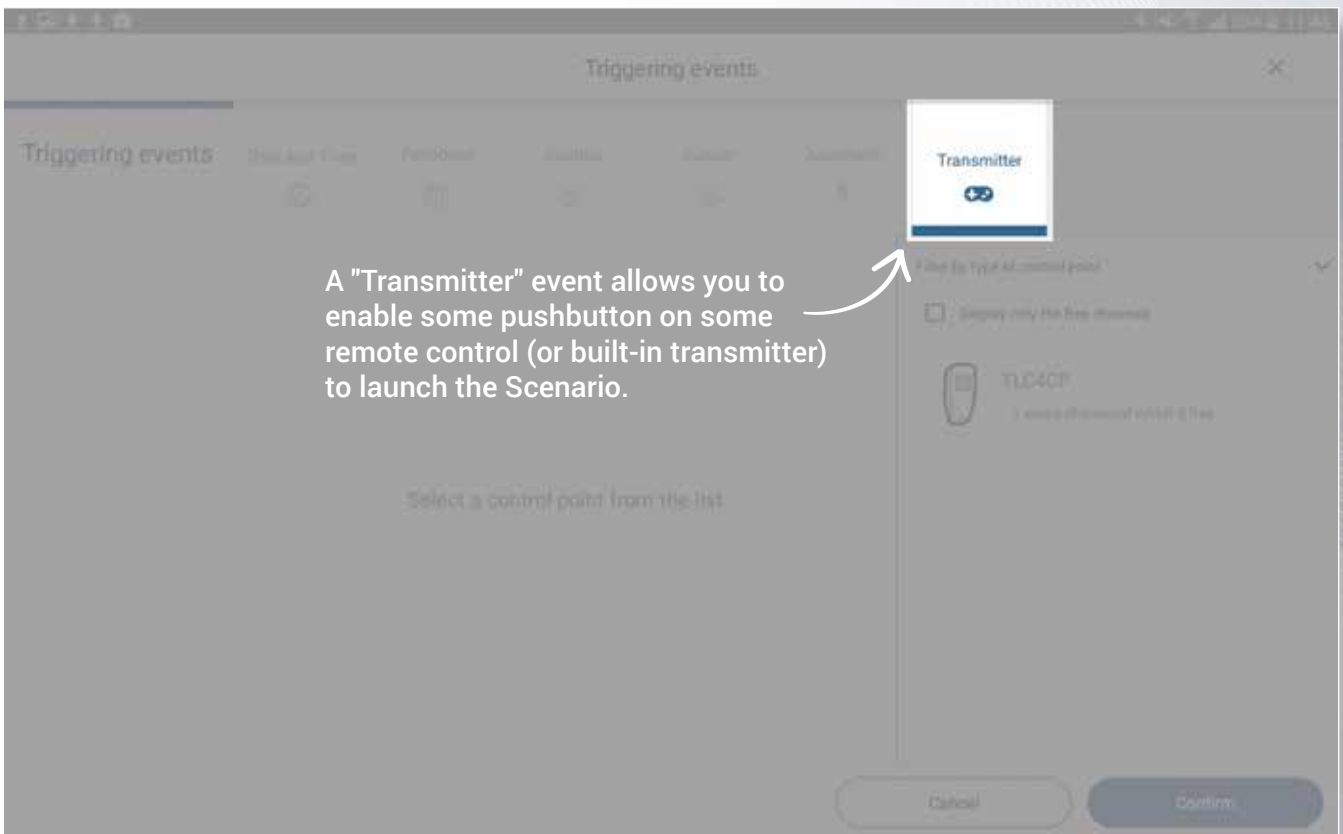

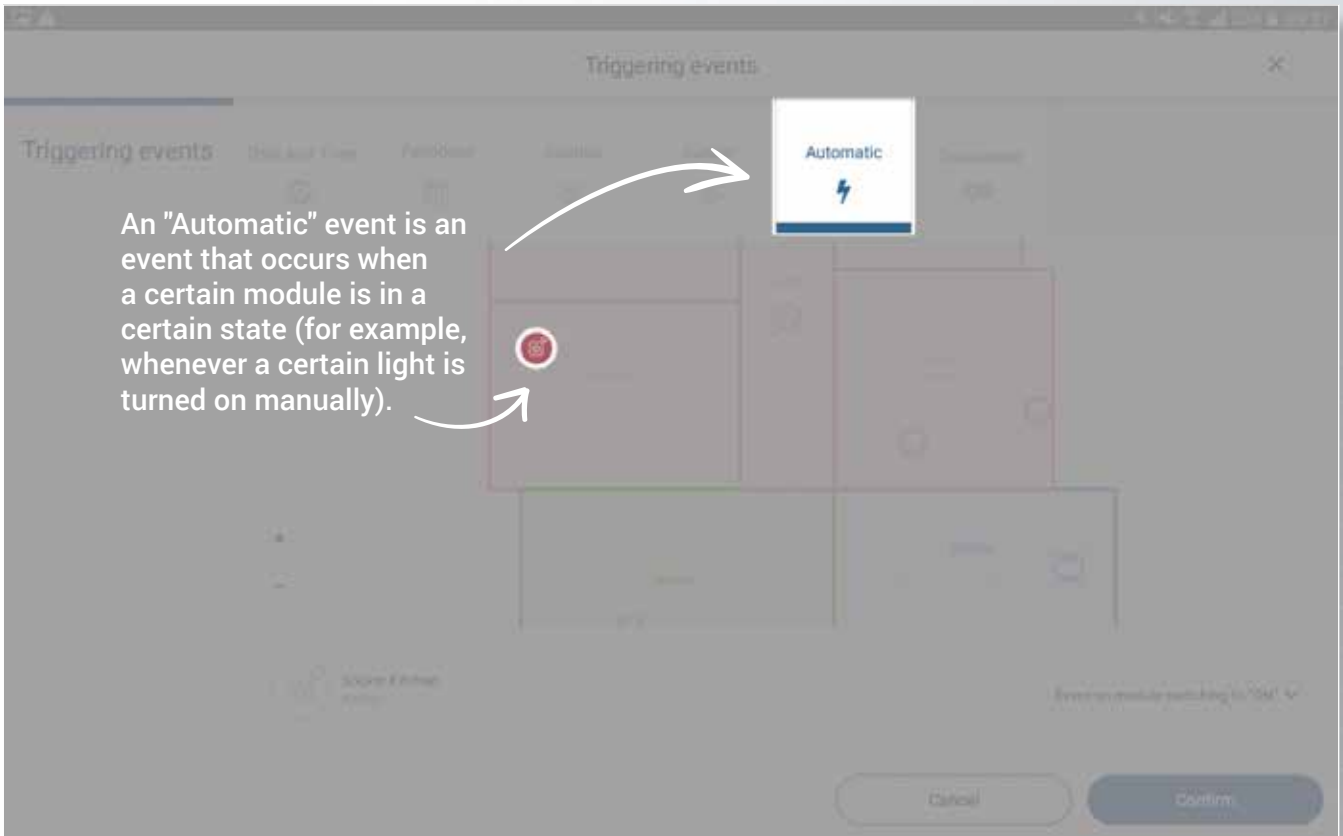

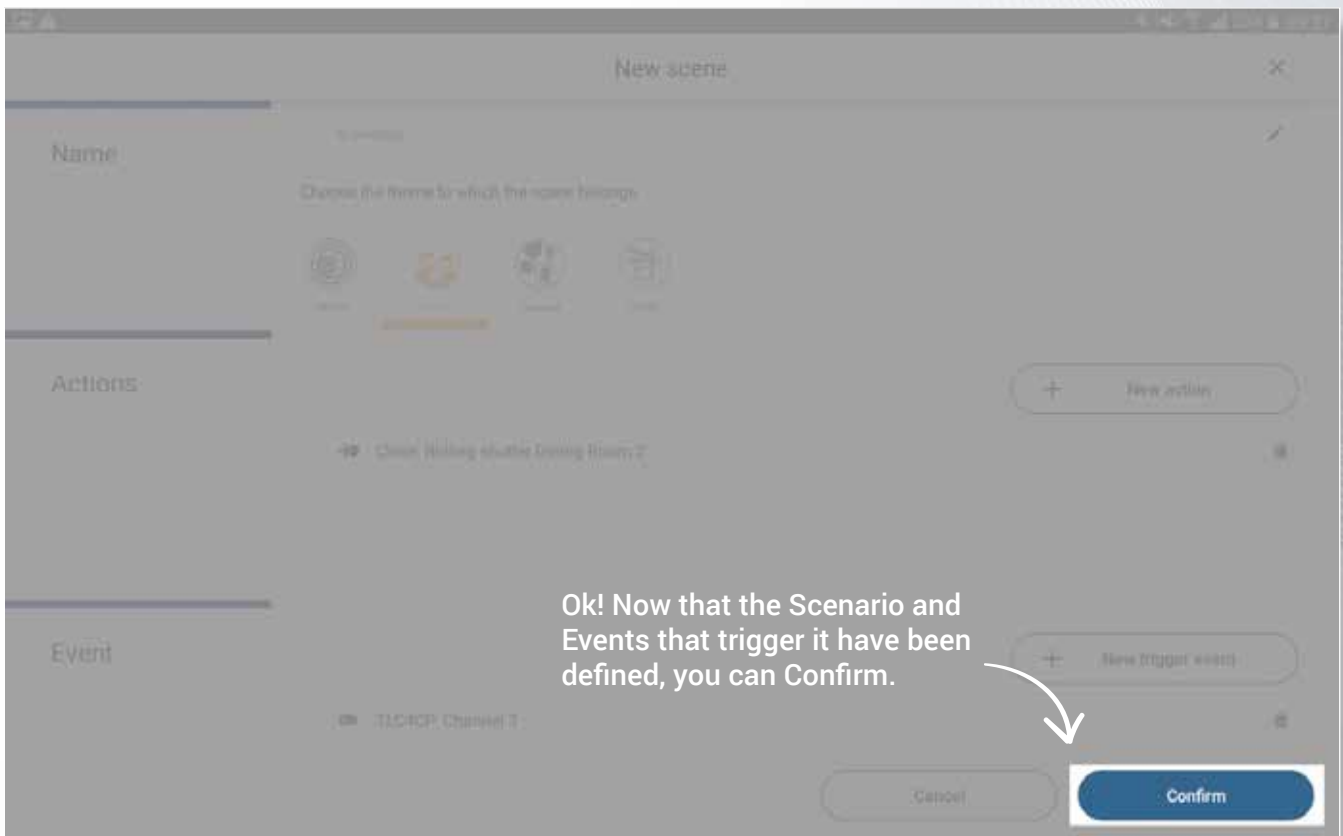

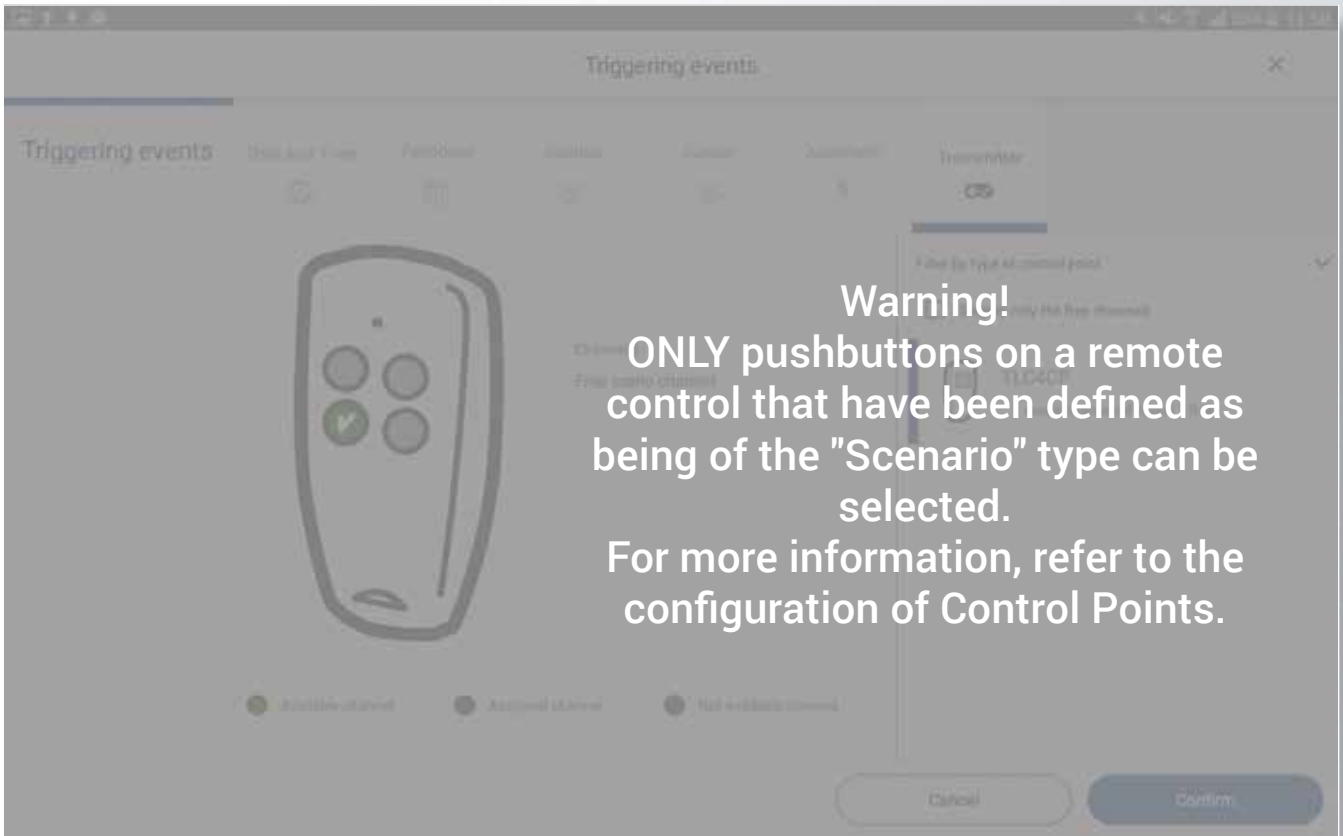

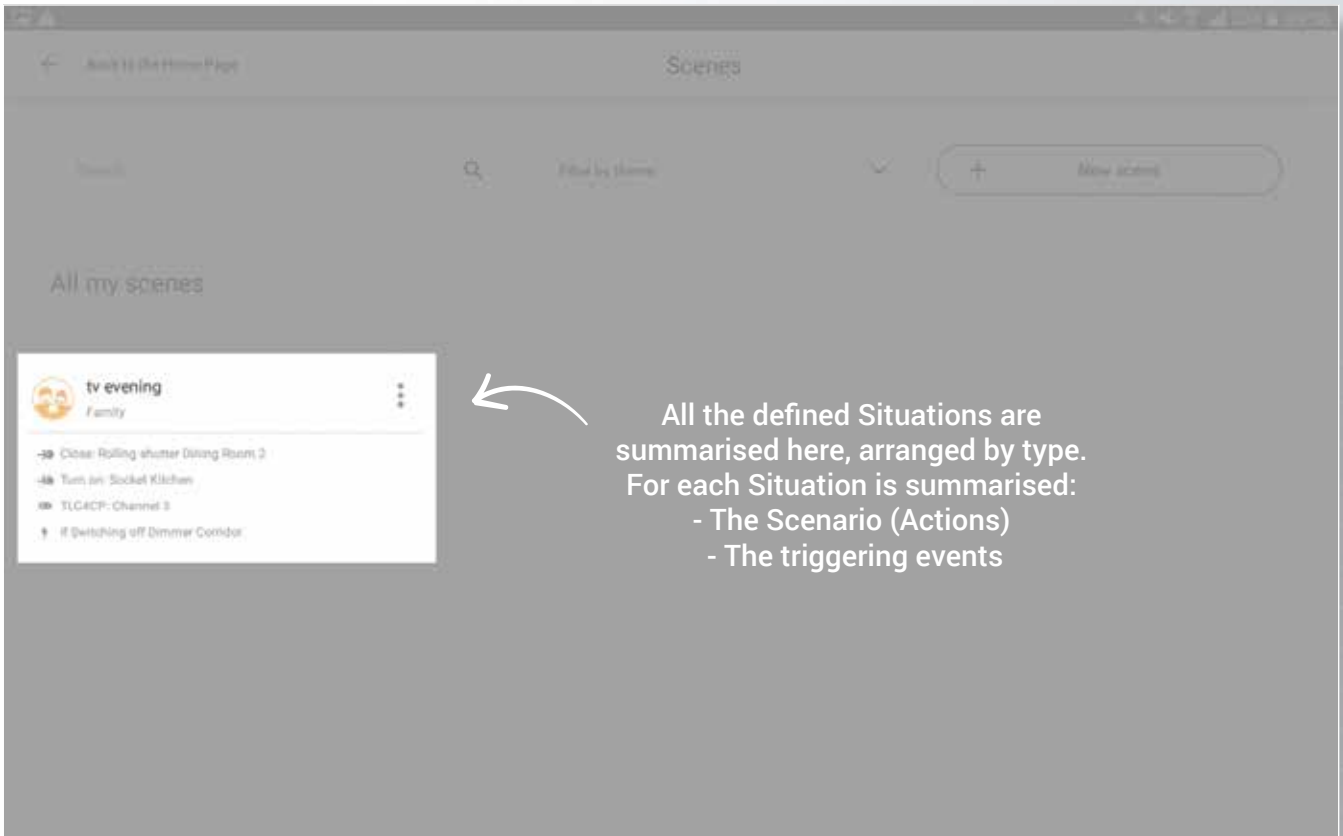

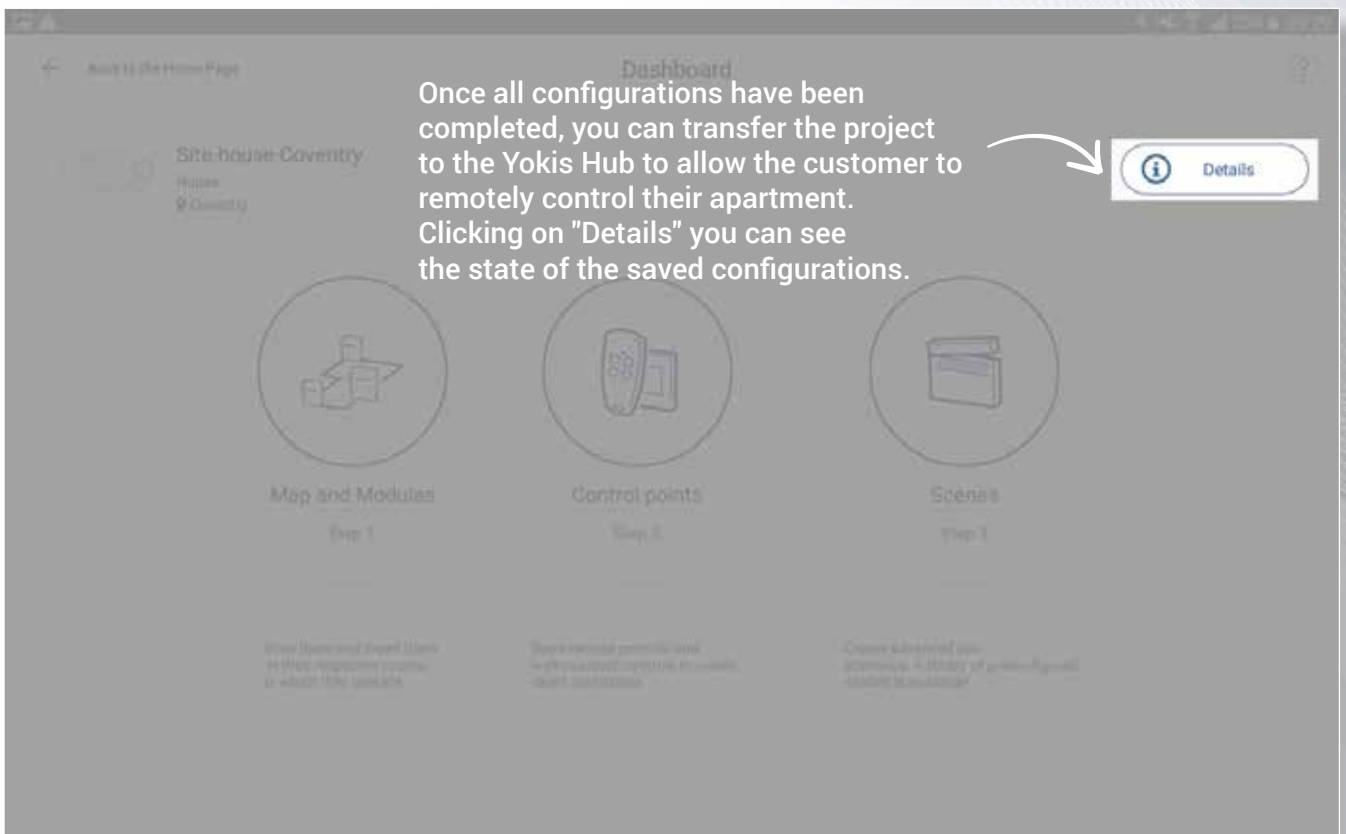

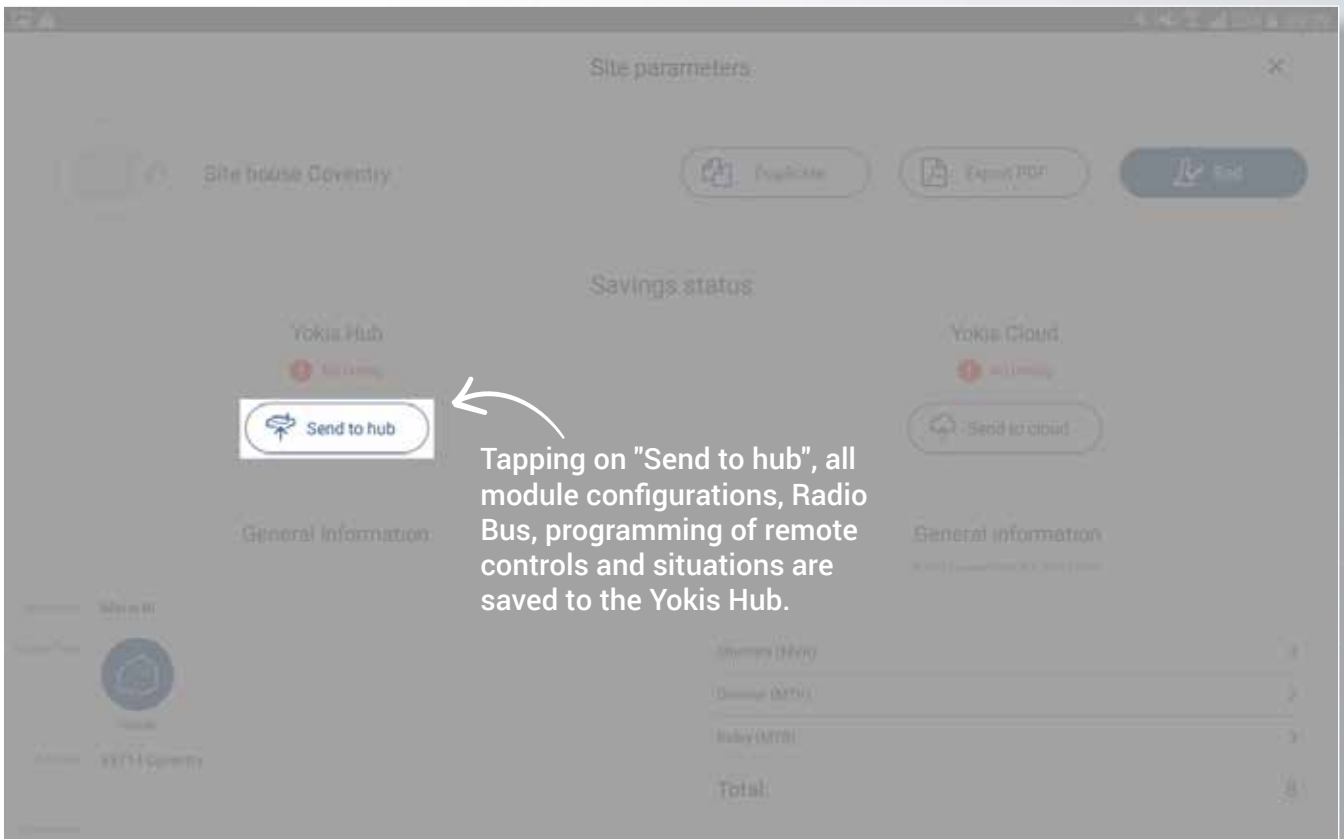

All the defined Situations are summarised here, arranged by type. For each Situation is summarised:

- The Scenario (Actions)
- The triggering events

Transfer of the system to the customer
 Transfer the system to the Yokis Hub

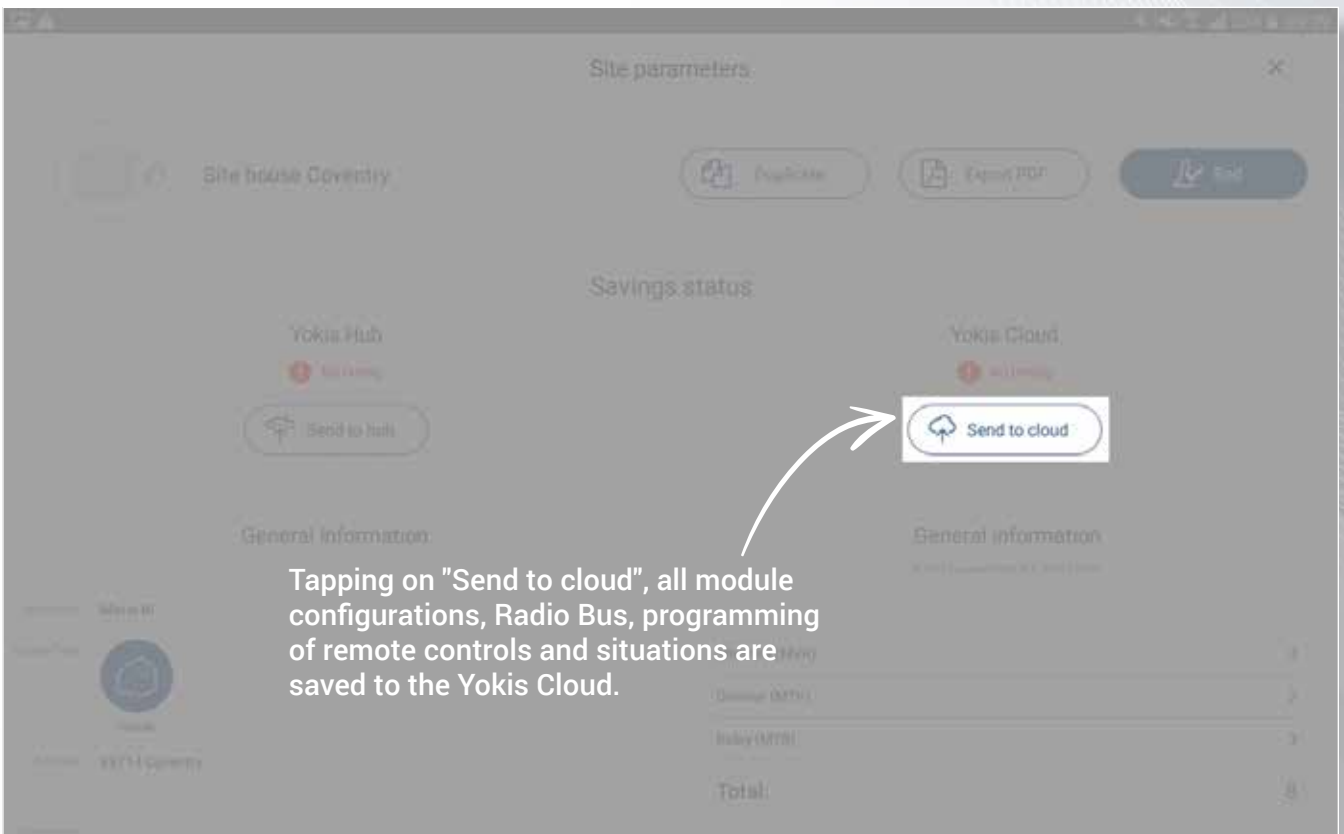

Once all configurations have been completed, you can transfer the project to the Yokis Hub to allow the customer to remotely control their apartment. Clicking on "Details" you can see the state of the saved configurations.

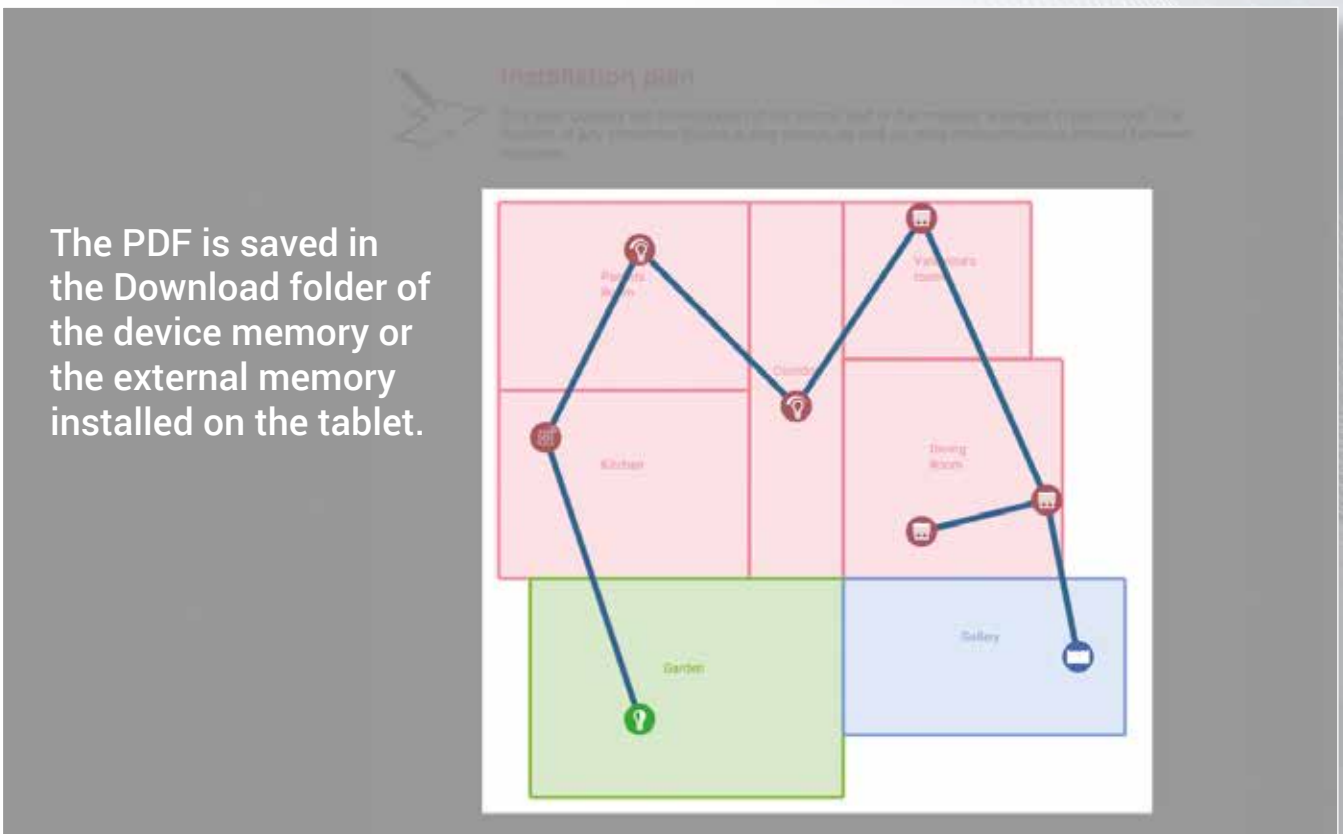

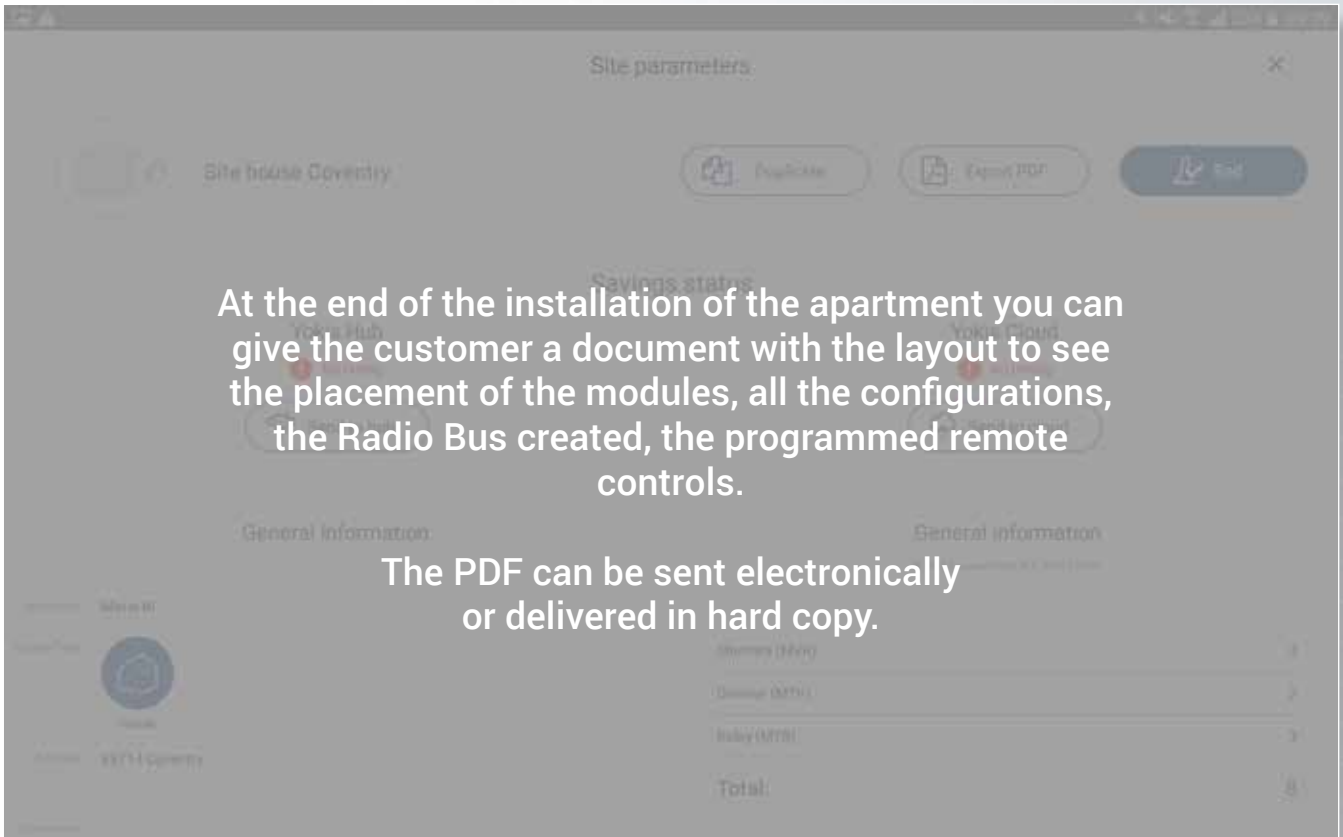

Transfer of the system to the customer

Transfer the system to the Yokis Cloud

Transfer of the system to the customer

Print the PDF of the system

Example of PDF:

- Channel 2 - Toggles On/Off : the zone : "dining room "
- Channel 3 - Launches scene : tv evening
- Channel 4 -

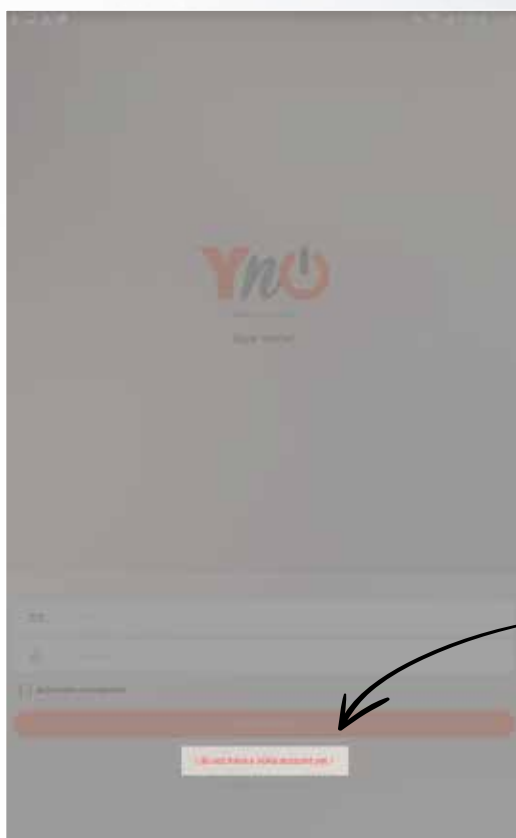

My wall-mounted remote controls

My flush-mounted transmitters

Transfer of the system to the customer

Access the system with the YnO app

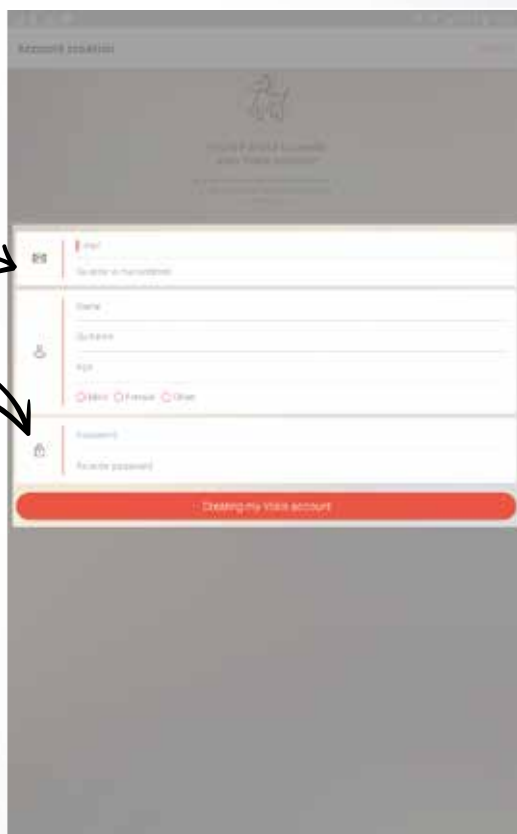

The CUSTOMER must download the YnO app from the store and install it on his/her smartphone.

Tap on «I don't have a Yokis account yet».

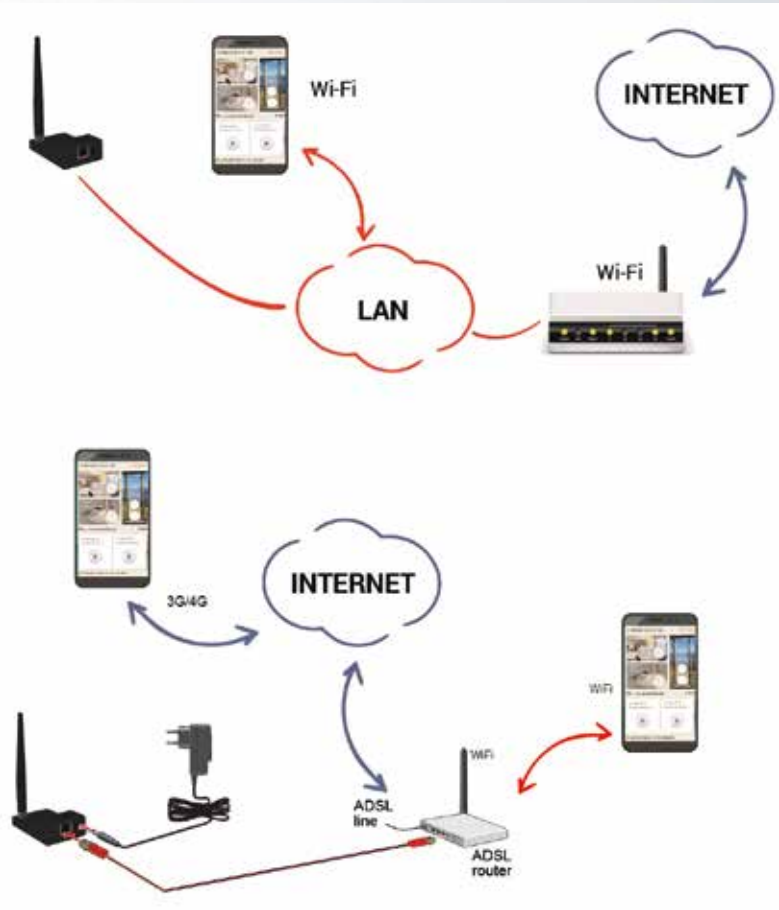

The CUSTOMER will have to enter his/her credentials, specifically:

- email address
- password

Then confirm to create the CUSTOMER account.

To "Add the system" to the YnO app the CUSTOMER's smartphone must be connected to the home LAN via Wi-Fi, the same to which the Yokis Hub is connected by cable.

WARNING: This LAN must also be connected to the Internet.

The CUSTOMER will now have to tap on the button that appears in the centre of the screen.

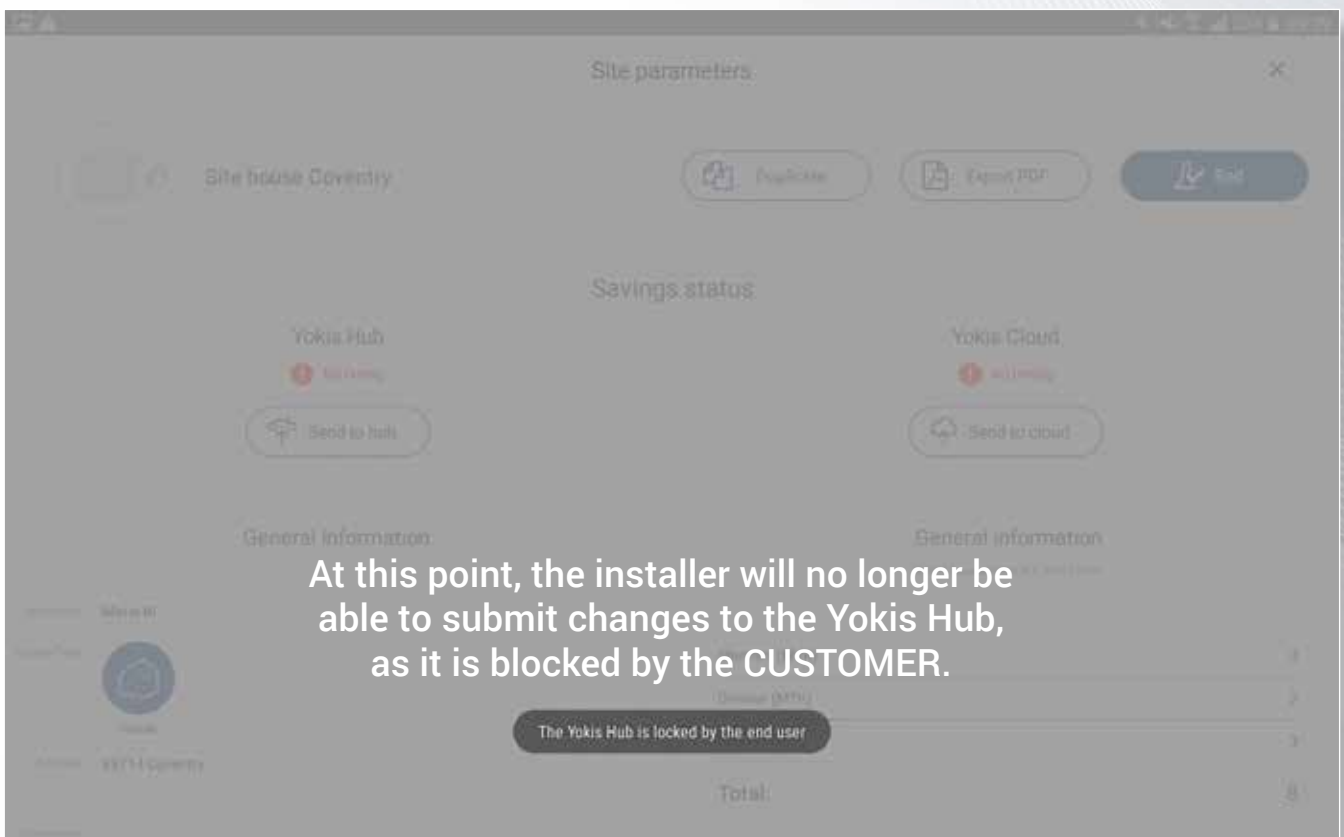

After a short search, the detected Yokis Hub will appear. The CUSTOMER will confirm that he/she wants to link to it.

At this stage all the data that the installer had previously stored inside the Yokis Hub through the PRO app will be transferred via Wi-Fi to the CUSTOMER's smartphone.

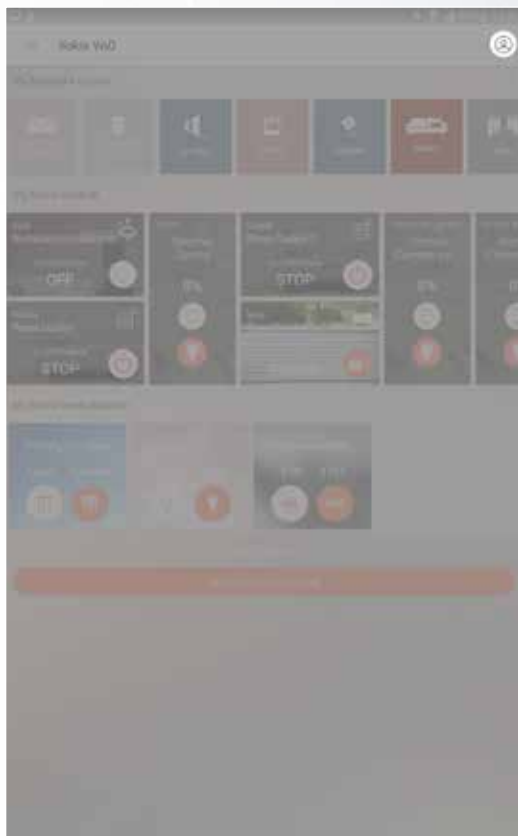

The CUSTOMER can now access the system.

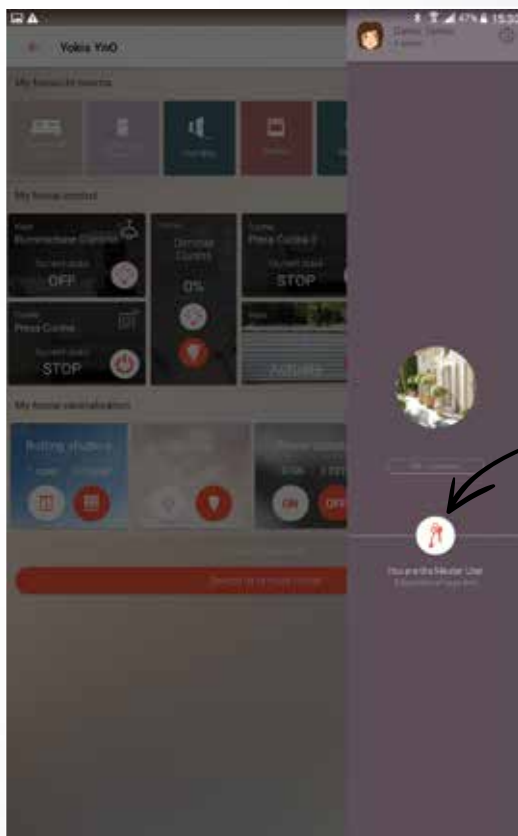

At this point, the installer will no longer be able to submit changes to the Yokis Hub, as it is blocked by the CUSTOMER.

Maintenance of the customer's system

In case of technical service, the CUSTOMER will have to "give" the installer his/her "Keys" to allow access and changes.

The CUSTOMER will tap on the icon at the top right.

Then, on the right side bar that will open, he/she will need to tap on the "Keys".

Finally on the installer icon.

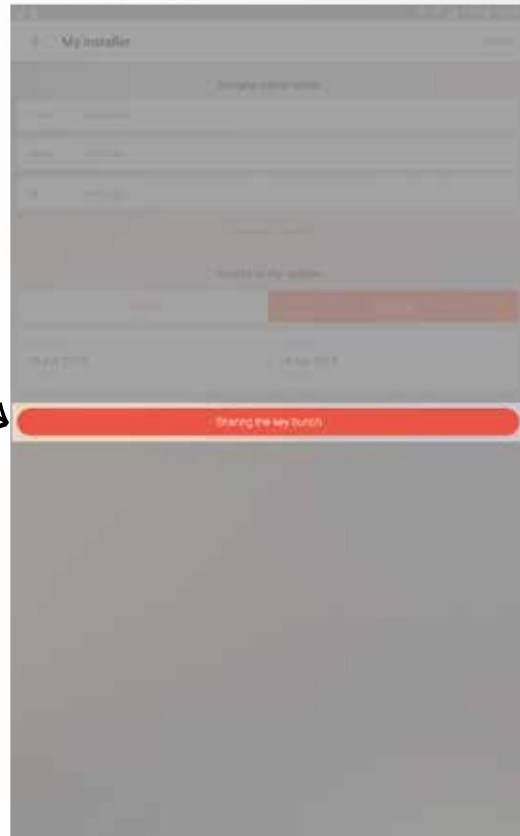

At this point
CUSTOMER
will authorise
the installer...

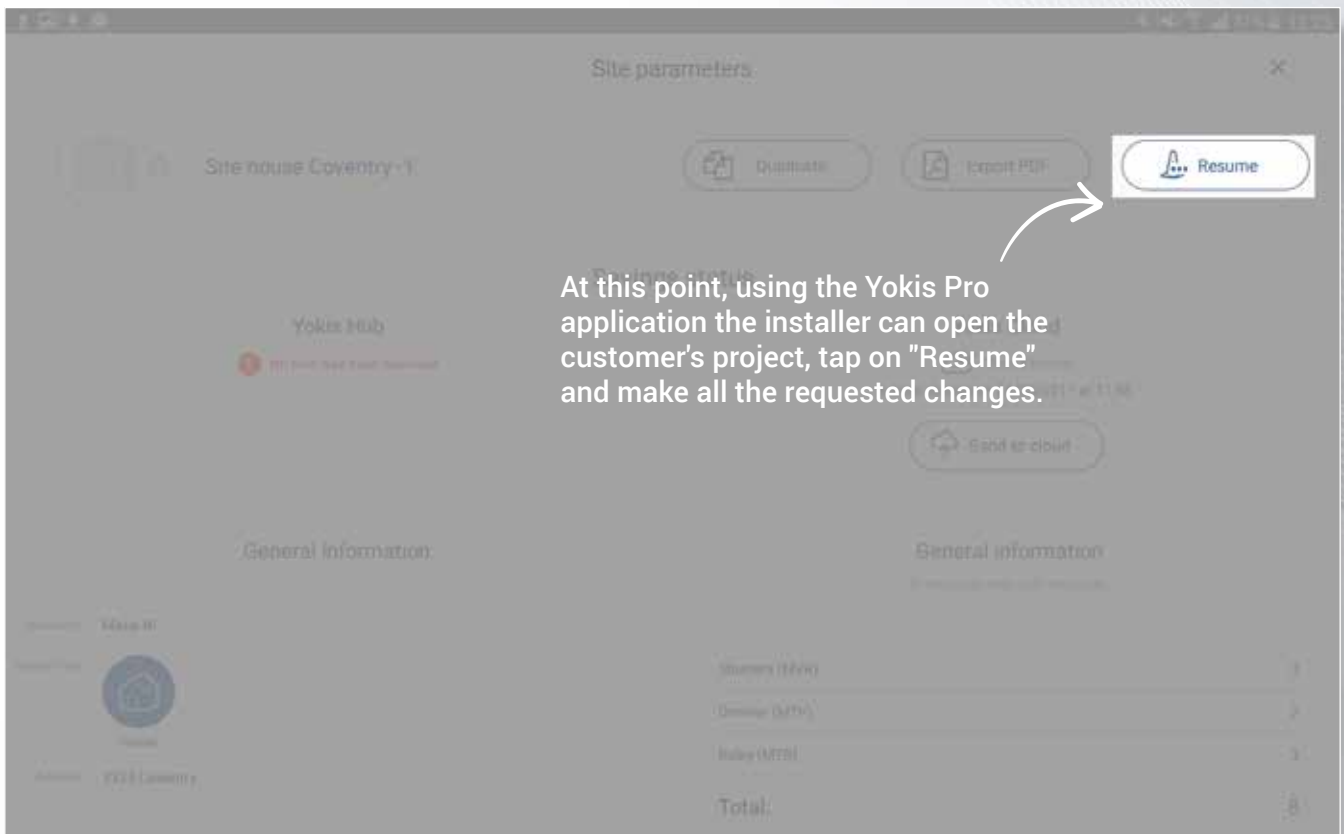

... for a certain
period of time.

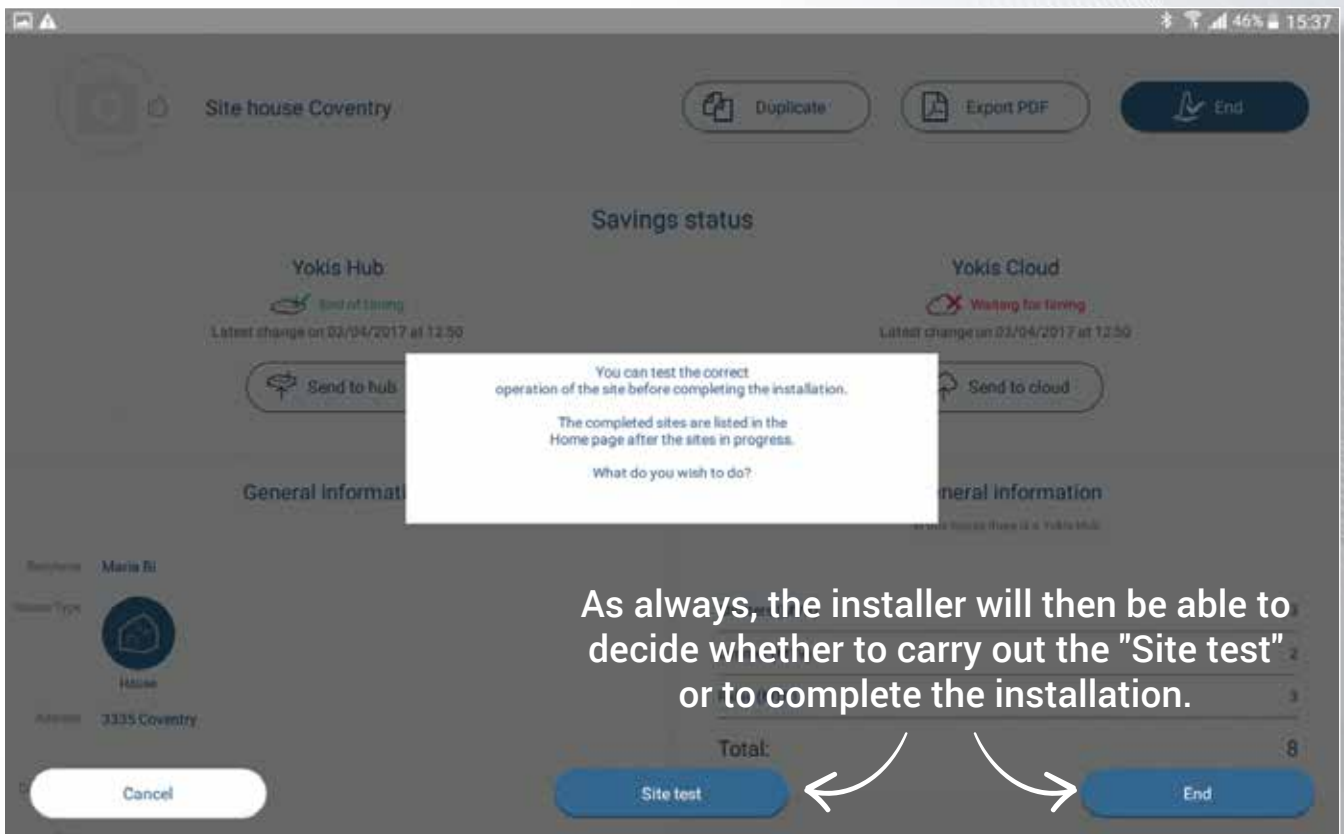

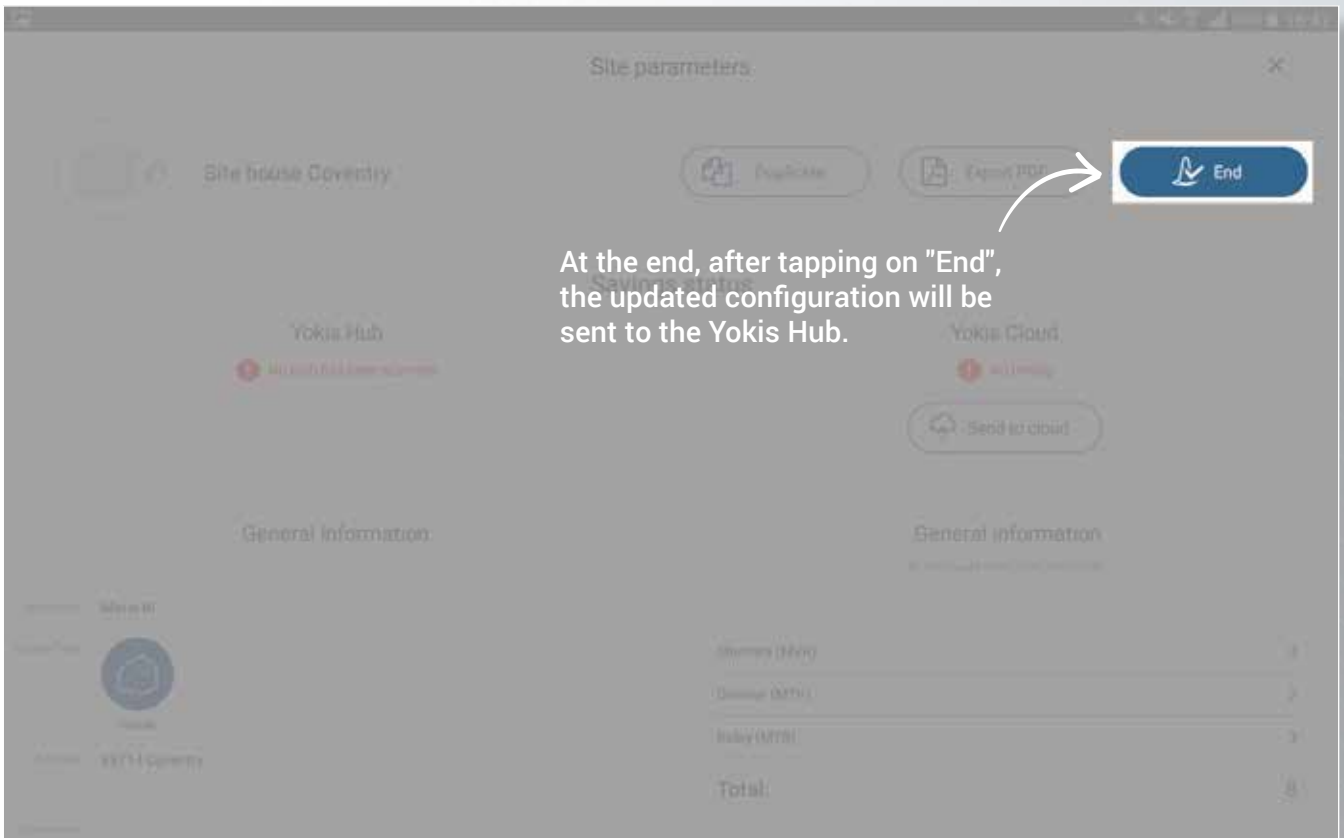

And will confirm by tapping "Sharing the key bunch".

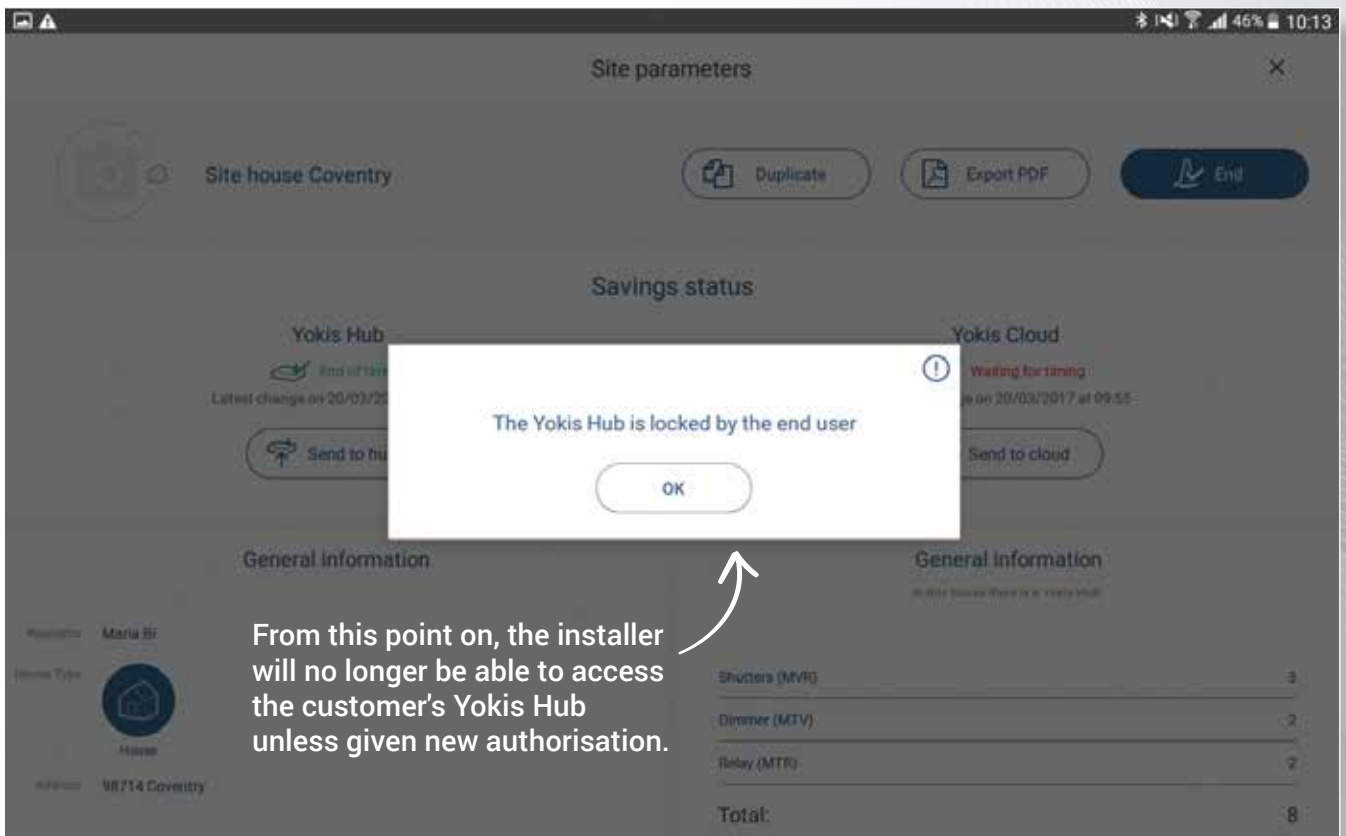

The CUSTOMER's YnO app will send an email to the installer's address to inform him/her that authorisation has been given to make changes to the system.

At this point, using the Yokis Pro application the installer can open the customer's project, tap on "Resume" and make all the requested changes.

If the maintenance activity ends earlier than expected, the CUSTOMER can manually revoke the authorisation.

From this point on, the installer will no longer be able to access the customer's Yokis Hub unless given new authorisation.

YOKIS PRO: SUMMARY OF FUNCTIONS AVAILABLE BASED ON THE SYSTEM

	Yokis Pro	Yokis Pro + Yokis hub	Yokis Pro + Yokis hub + Yokis Cloud
Creating and configuring a system	✓	✓	✓
